

Chemistry in Star Formation

Peter Schilke
University of Cologne

using slides prepared by
Álvaro Sánchez-Monge (UCologne)

Astrochemistry :

Study of *formation, destruction and excitation of molecules* in astronomical environments and their influence on the *structure, dynamics and evolution of astronomical objects*.

Dalgarno (2008, ARA&A, 46, 1)

Almost 200 molecules detected !!!

Galactic chemistry

Extragalactic chemistry

Goals

Astrochemistry

- Uses not excitation, but abundances of molecules as tracers of past and present physical conditions, source ages, feedback by outflows, shocks, UV...
- The more, the merrier
 - **More** lines – more reliable identification and characterization
 - Handle on opacities, blending
 - Constraints on physical conditions
 - **More** species – more constraints on chemical models

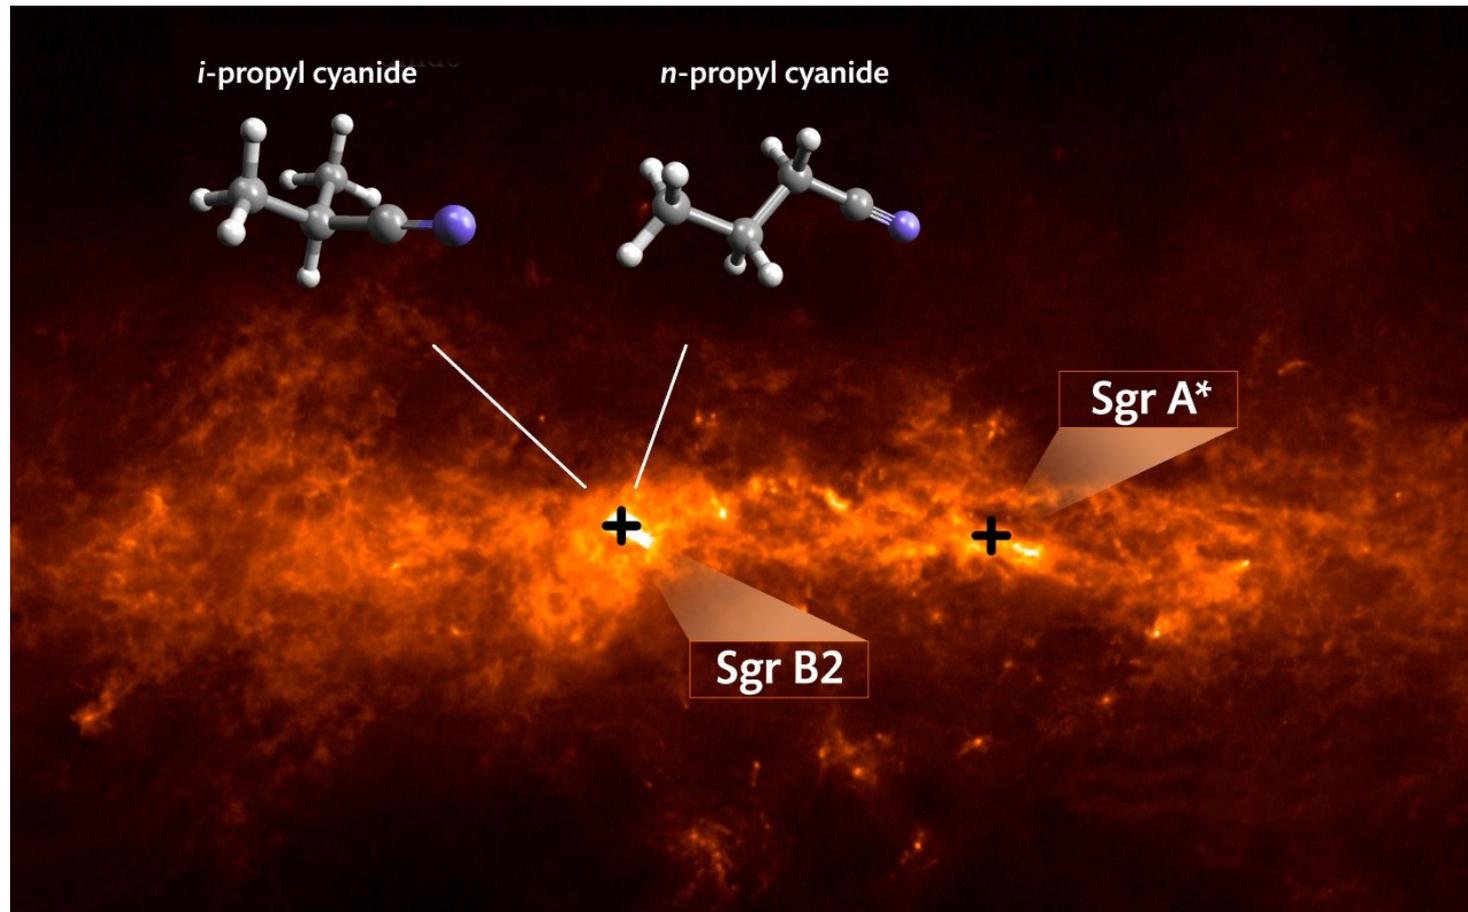

Large bandwidths are good

Examples of Chemistry in Star Formation

Example results

SgrB2

ALMA spectral scans to search for **new molecular species**

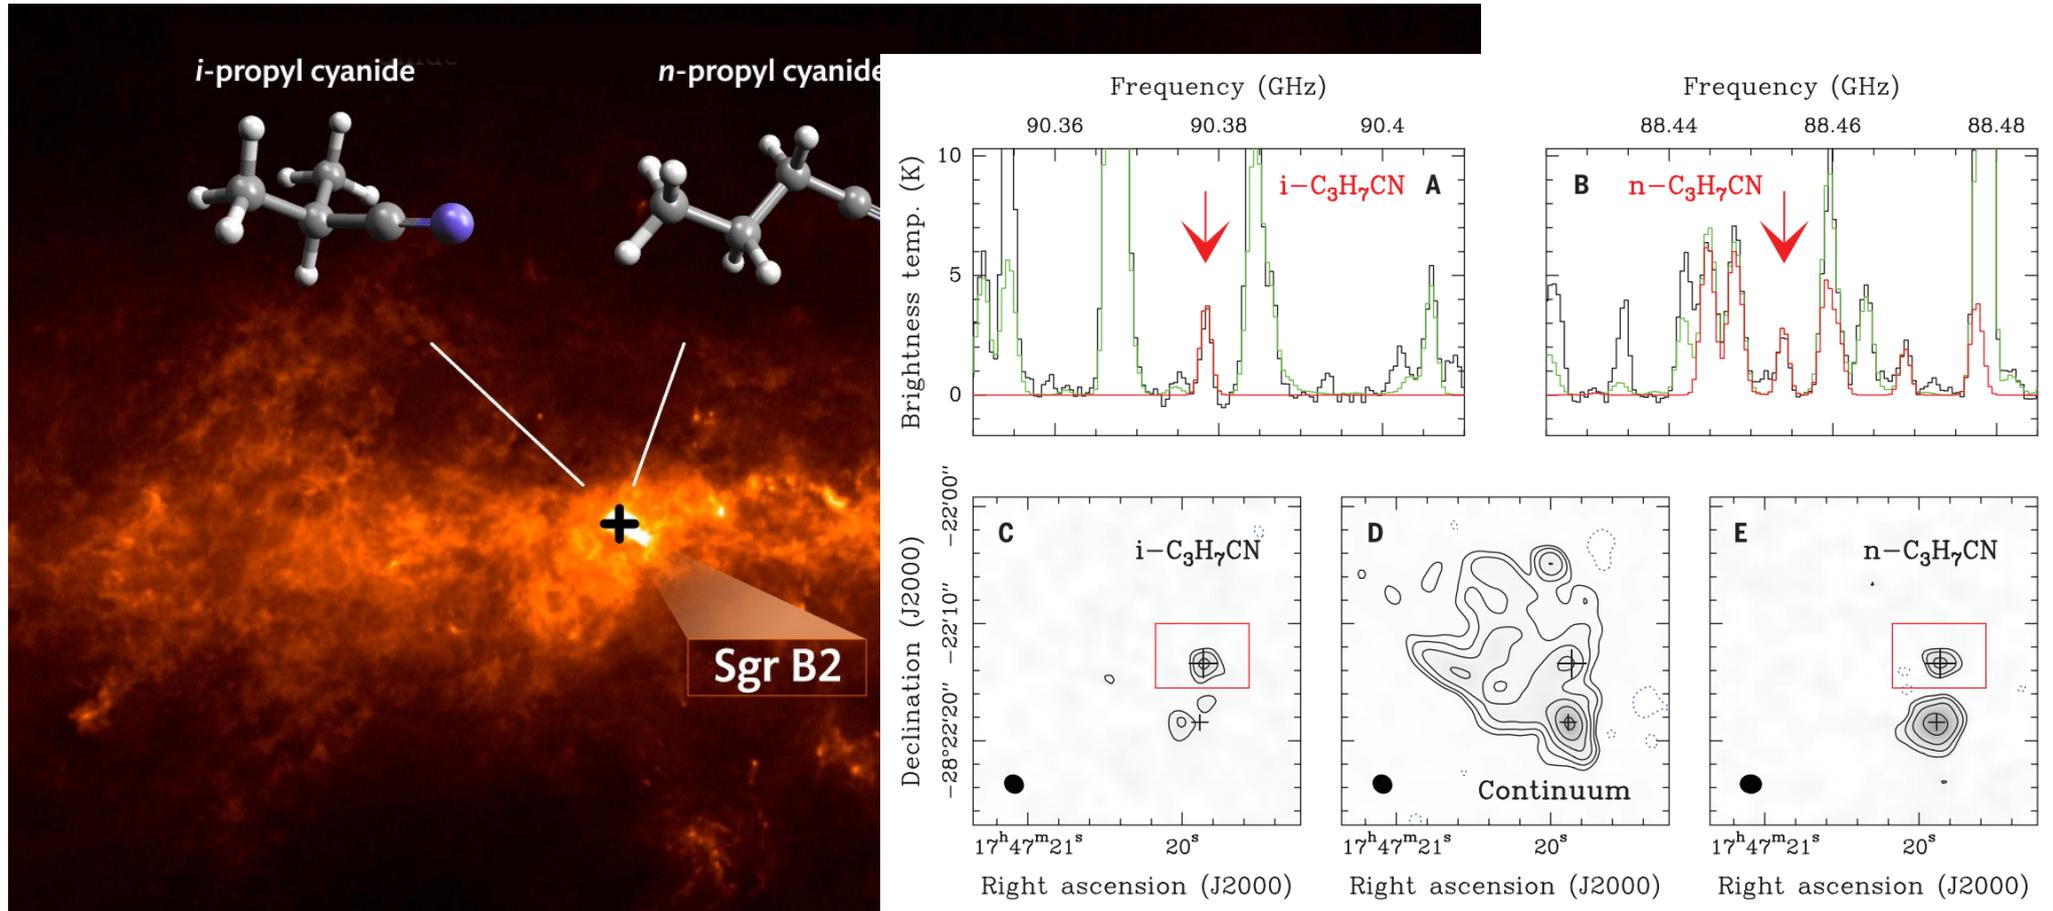

- Iso-propyl cyanide
- Alkanethiols and alkanols
- ¹³C-substituted ethyl cyanide
- Deuterated complex organic molecules
- Vibrationally excited n-propyl cyanide
- ...

Belloche et al. (2014, Science, 345, 1584) ; Belloche et al. (2016, A&A, 587, 91) ;
Müller et al. (2016, A&A, 587, 92) ; Müller et al. (2016, A&A, arXiv 1608.08129 ; and many more

Example results

SgrB2

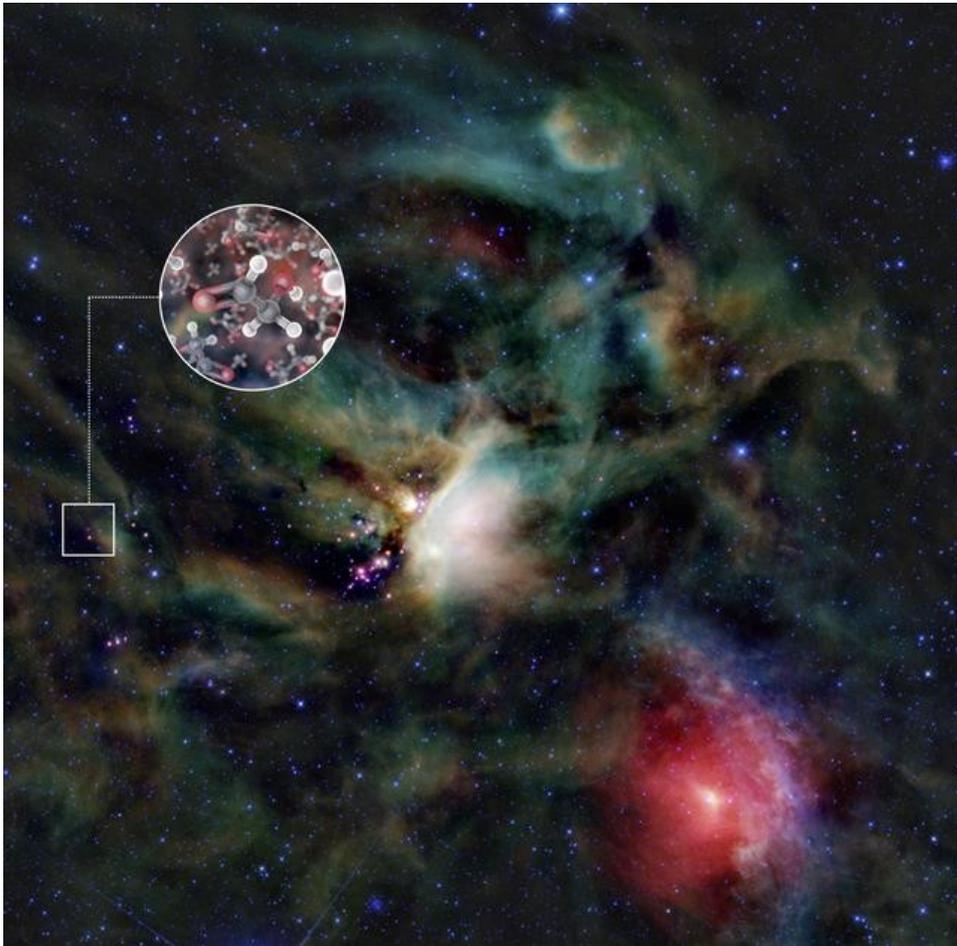

ALMA spectral scans to search for **new molecular species**

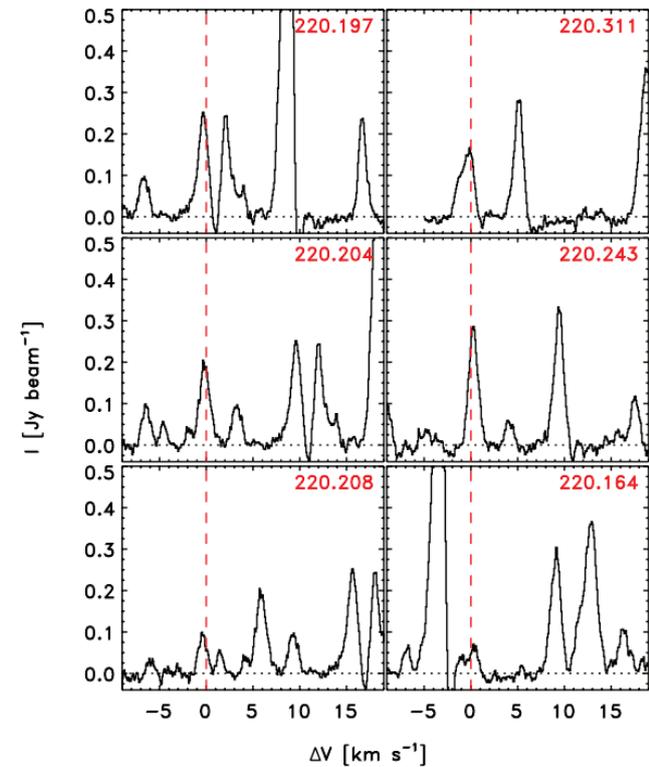

Belloche et al. (2014, Science, 345, 1584) ; Belloche et al. (2016, A&A, 587, 91) ;
Müller et al. (2016, A&A, 587, 92) ; Müller et al. (2016, A&A, arXiv 1608.08129

Example results

IRAS 16293-2422 (solar type star)

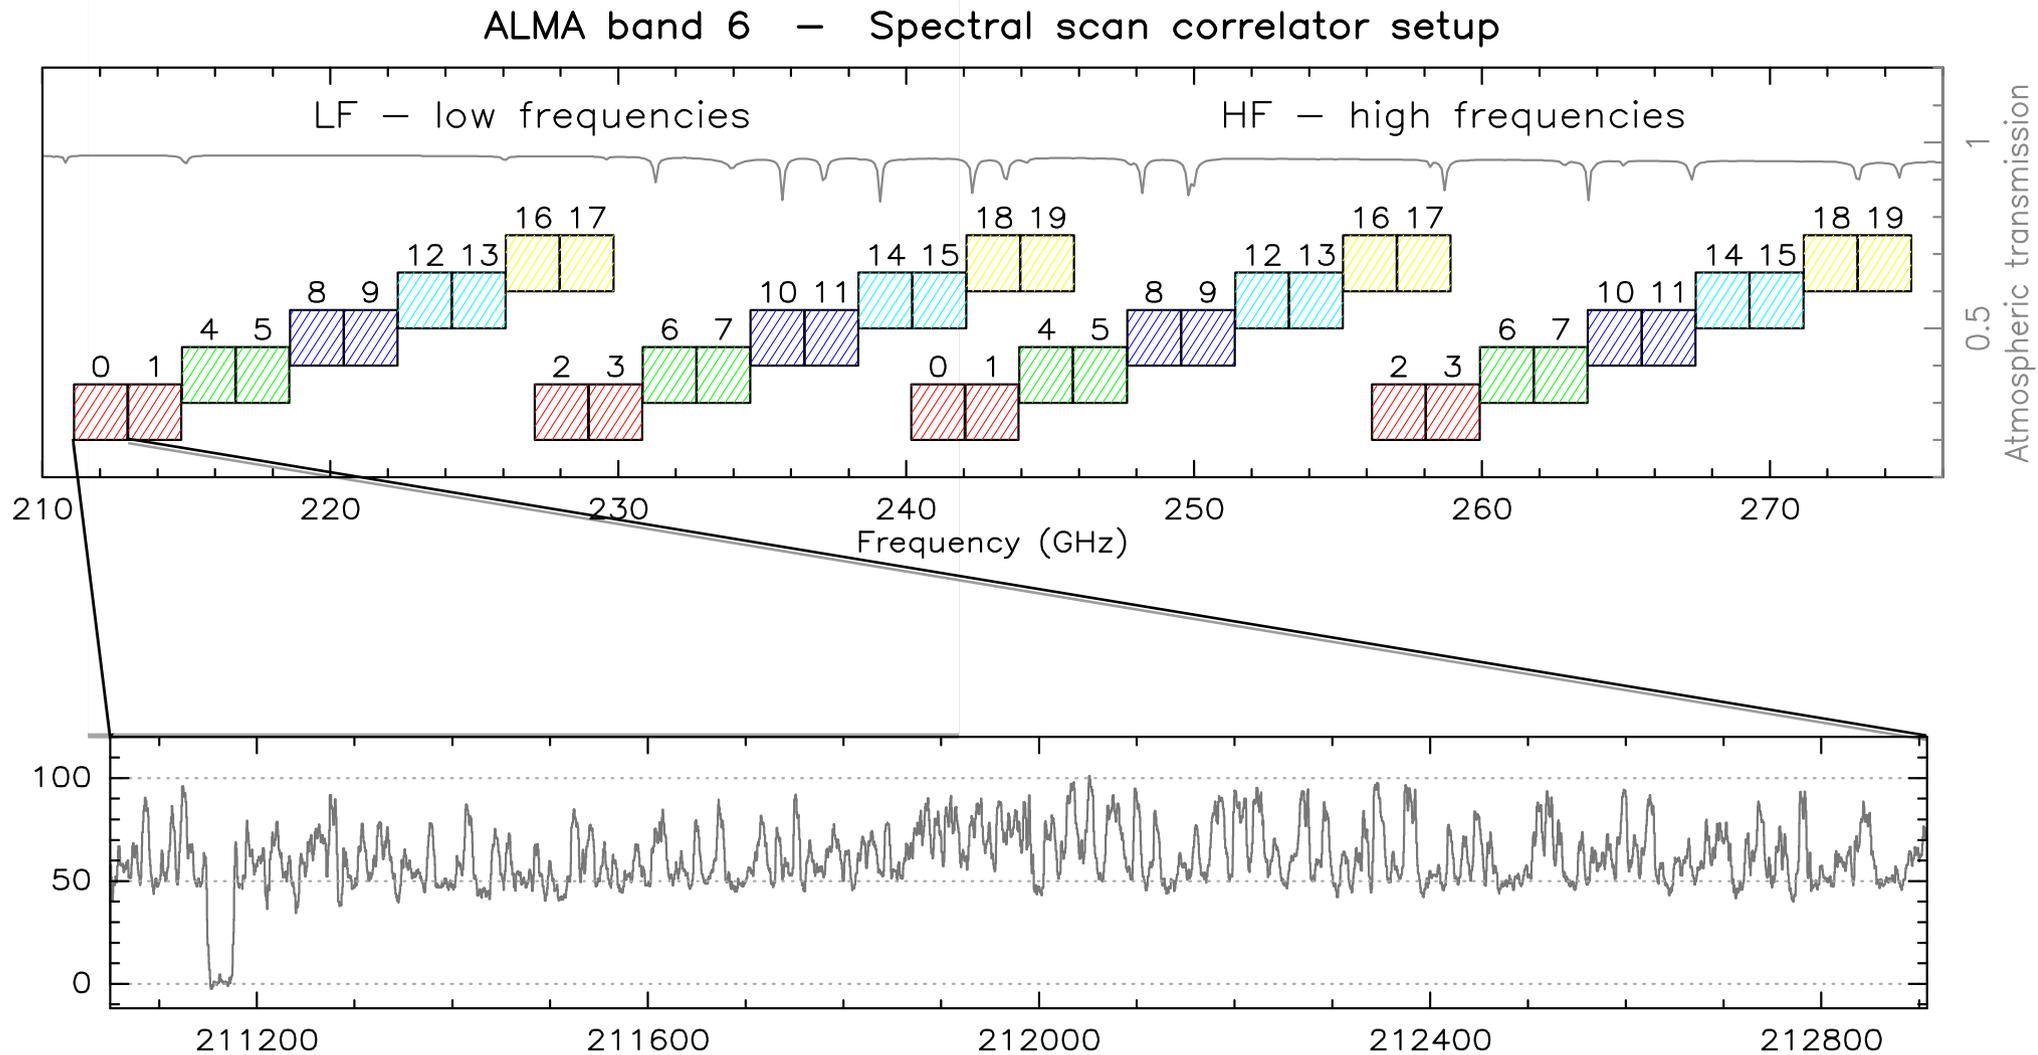

Detection of the simplest sugar in a solar-type protostar: Glycolaldehyde (HCOCH_2OH)

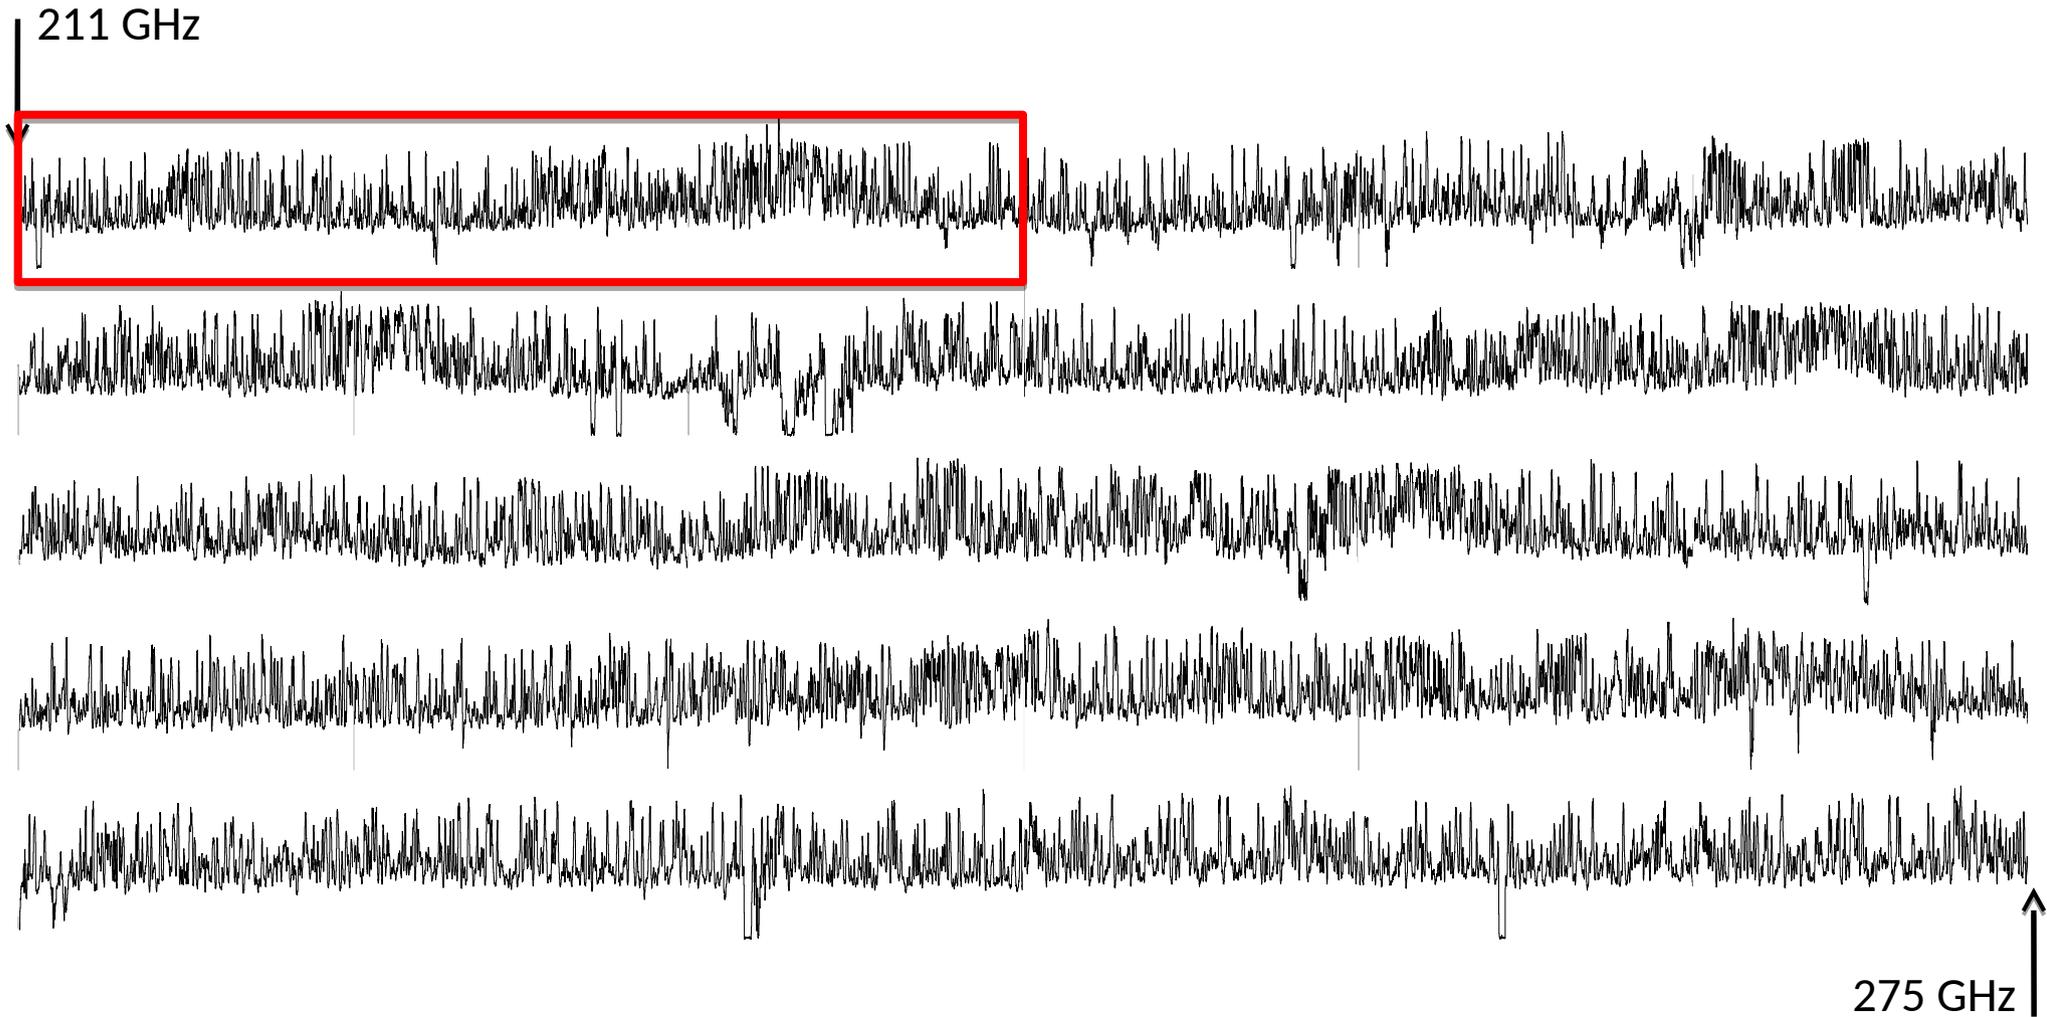

Jørgensen et al. (2012, ApJL, 757, L4) ; Jørgensen et al. (2016, A&A arXiv1607.08733)

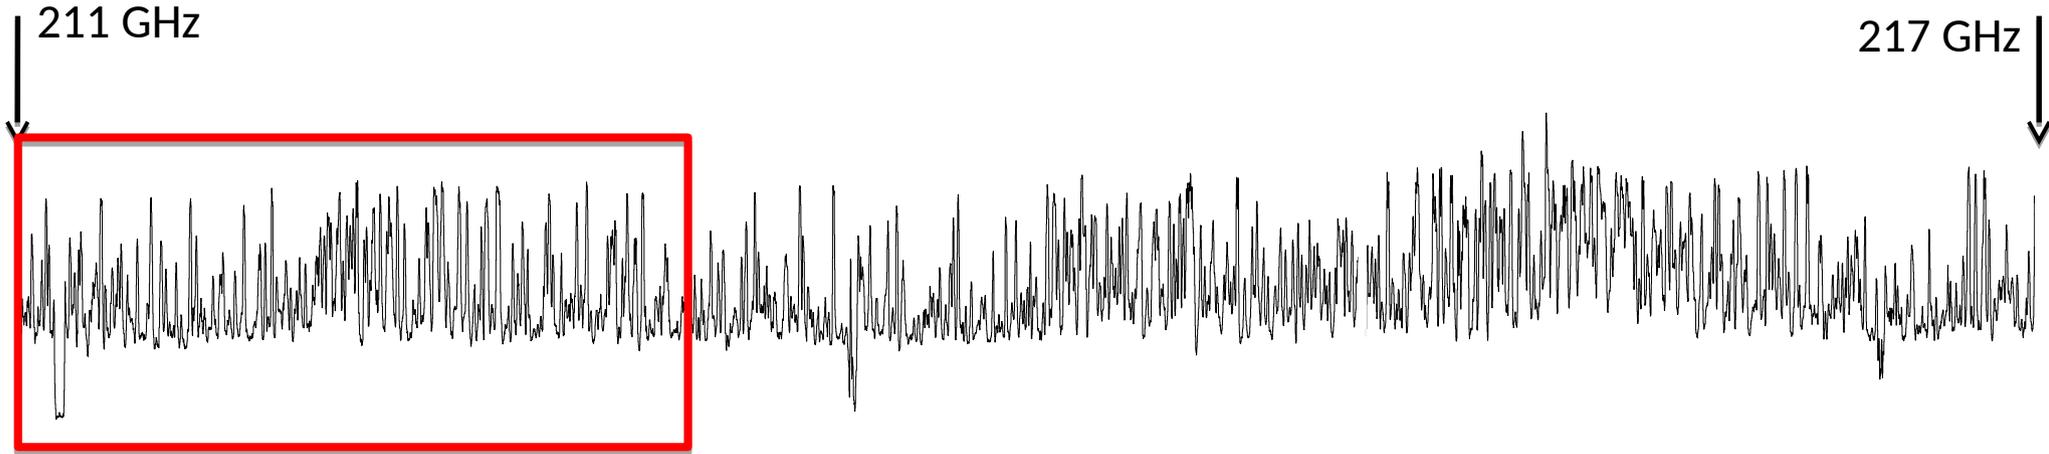

Example results: ALMA line survey of SgrB2 (M) and (N)

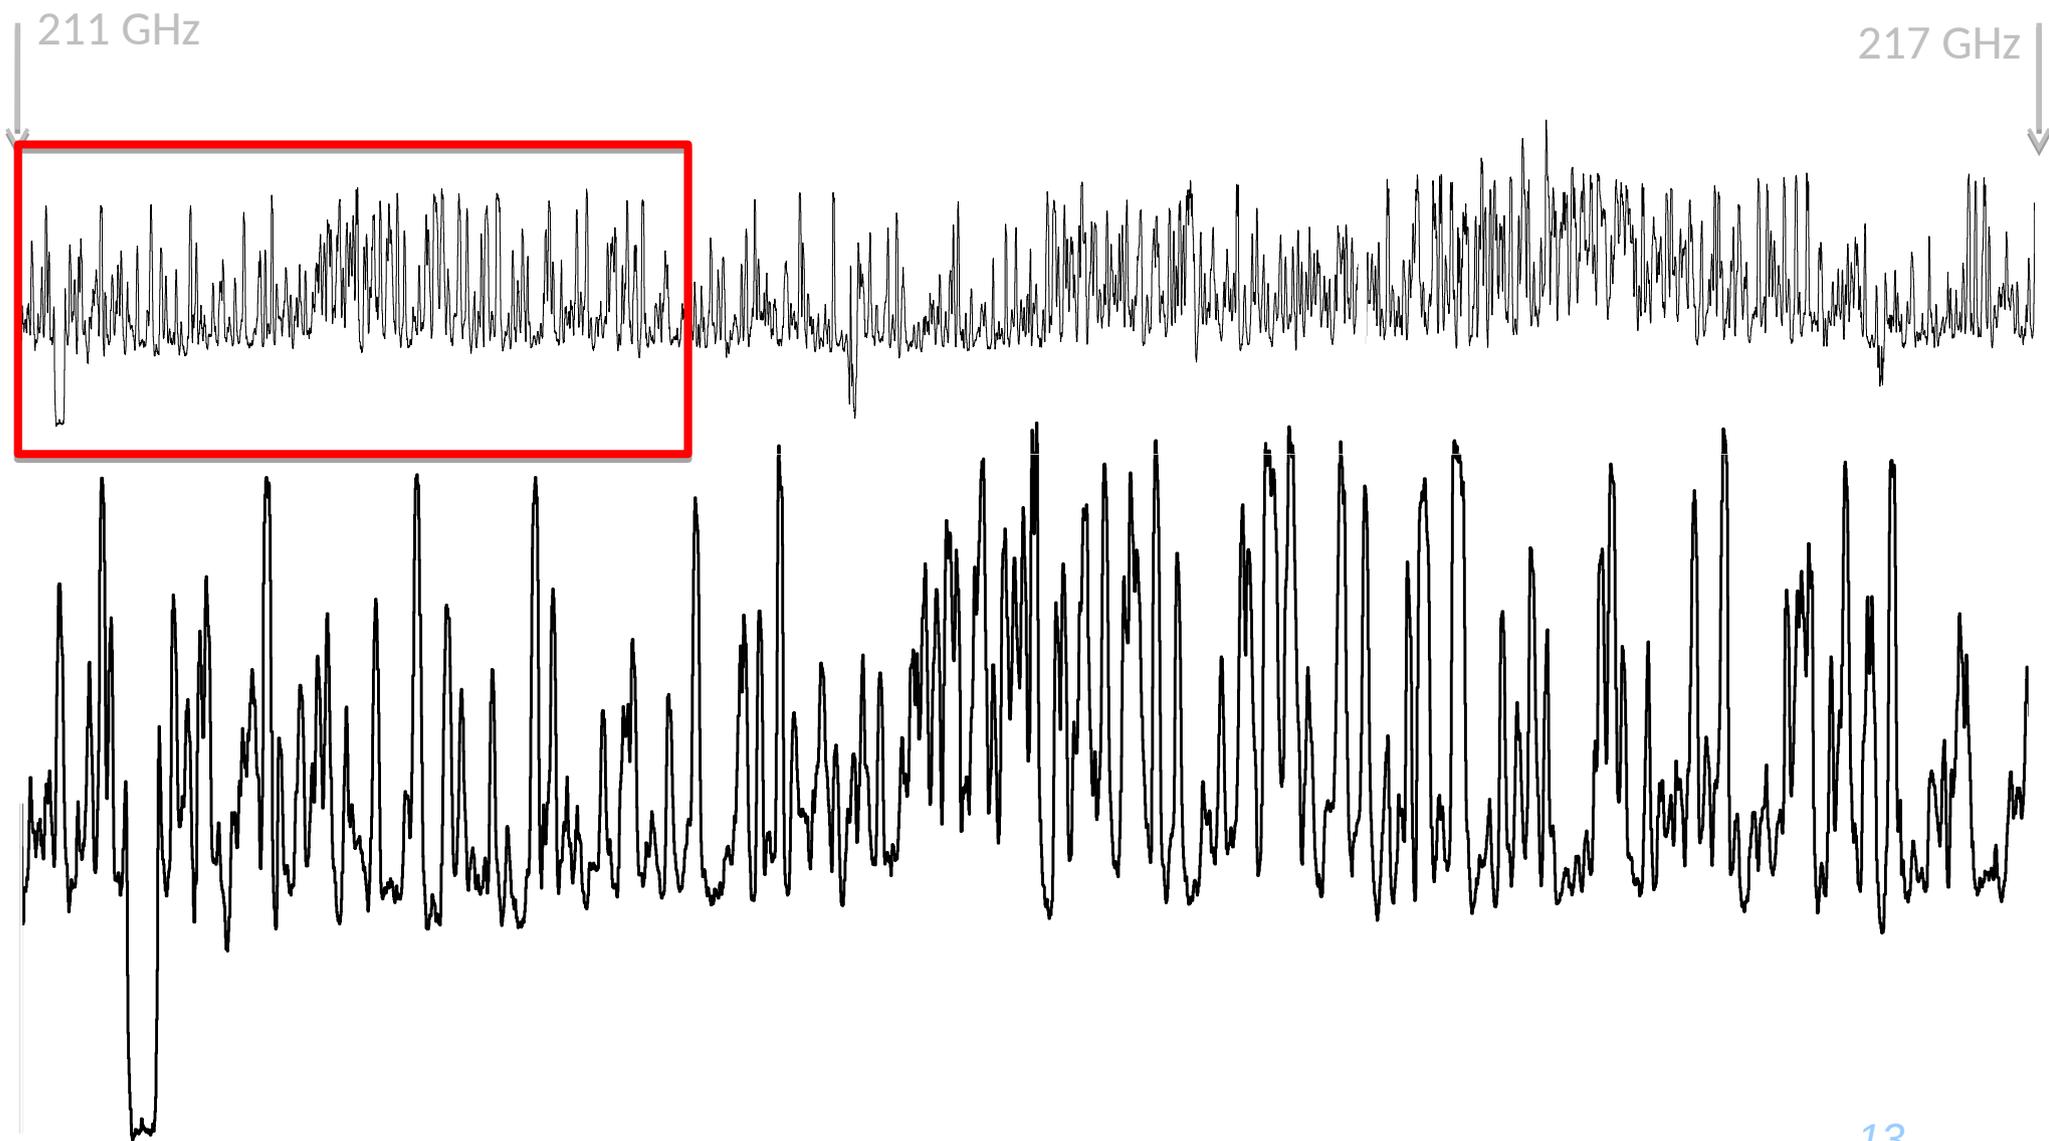

Spectrum (211-275 GHz) towards 1 single pixel

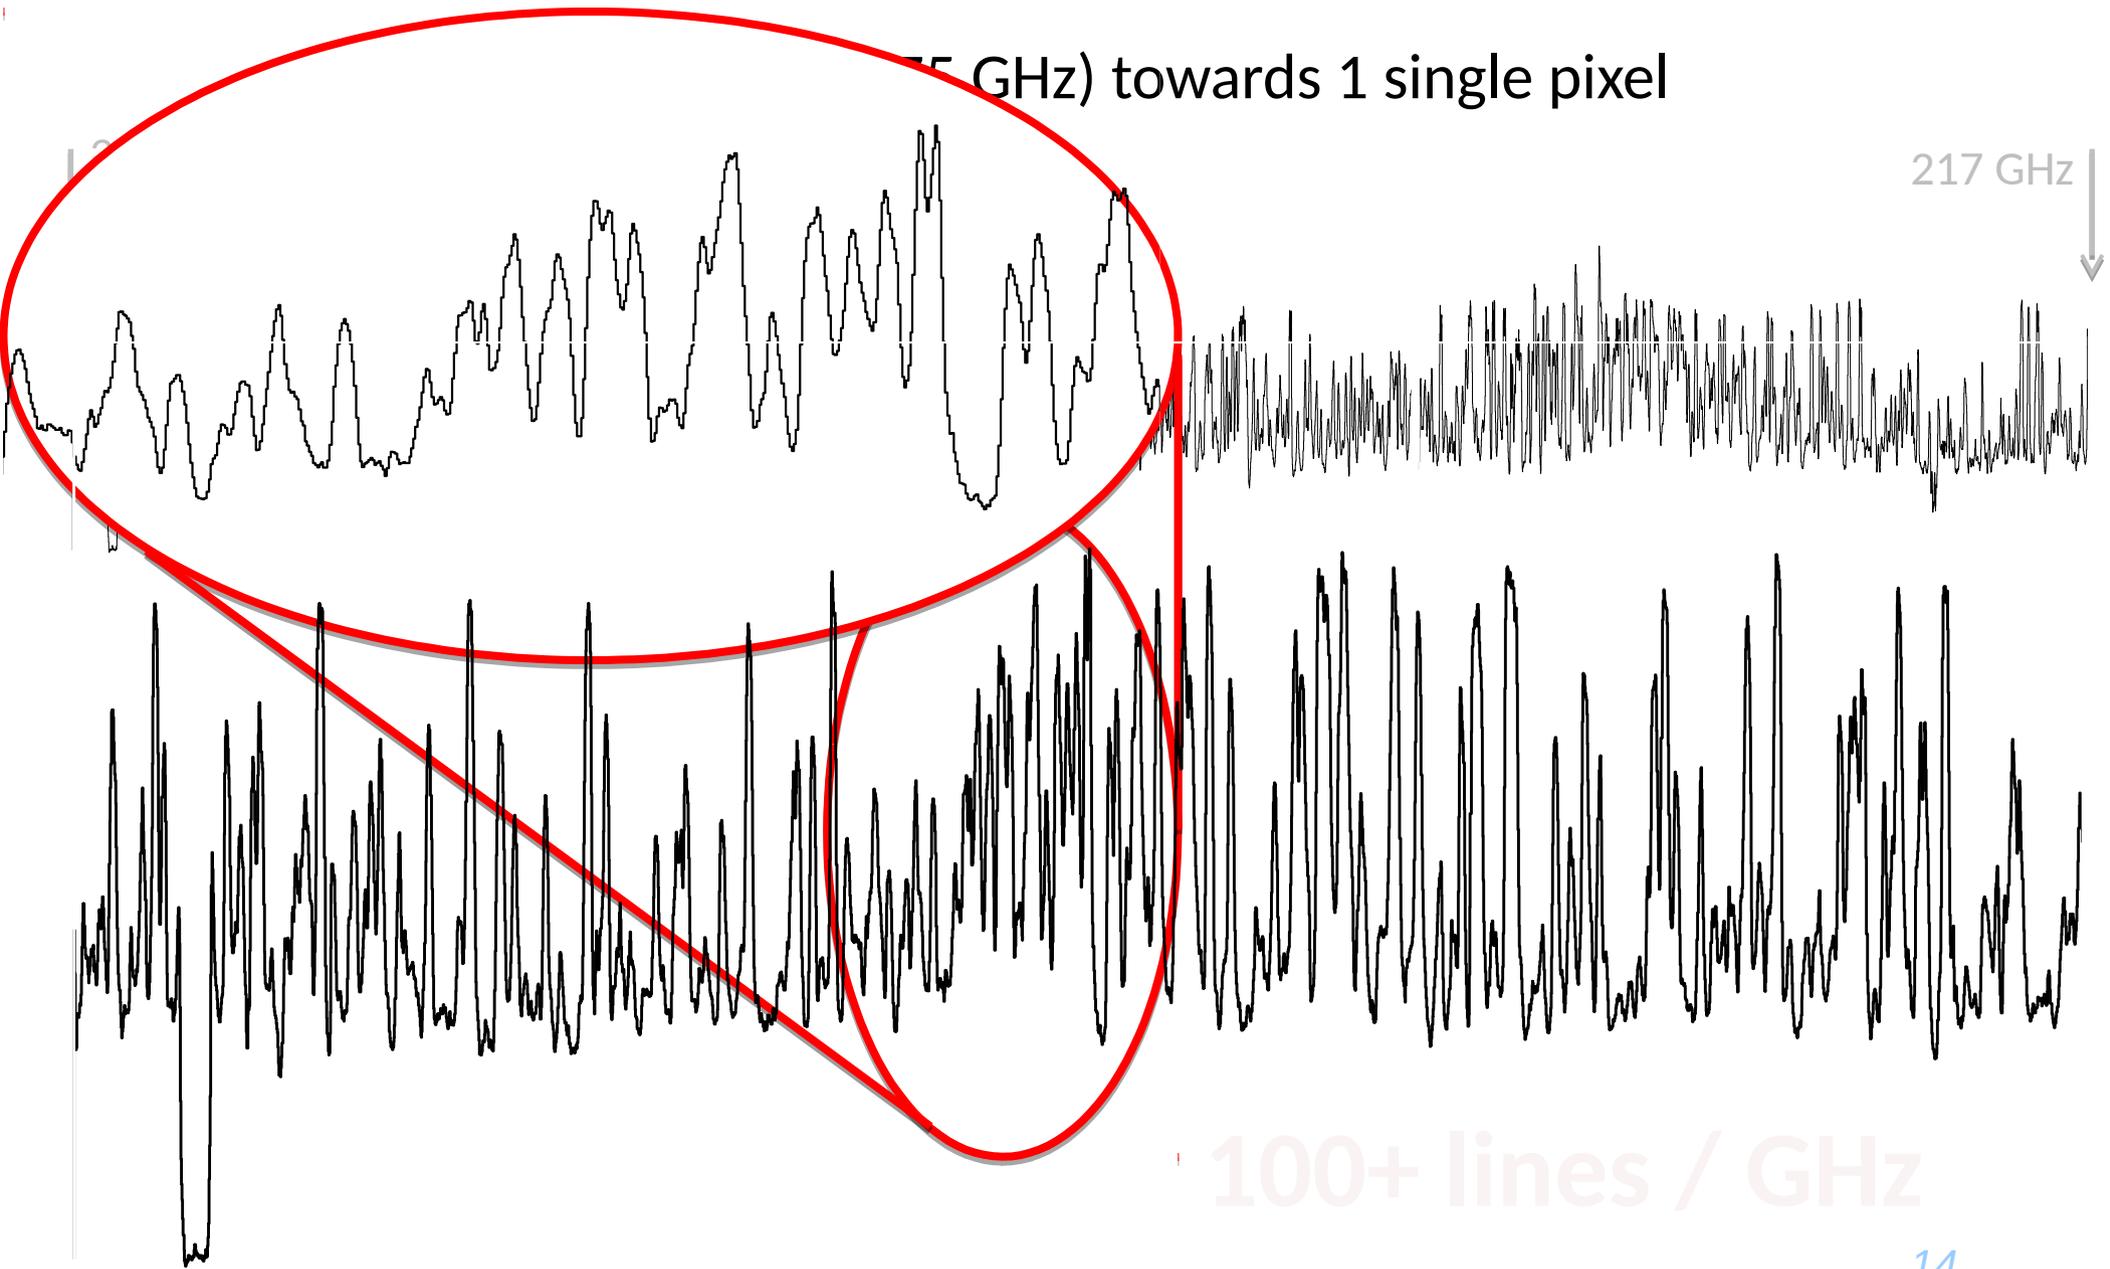

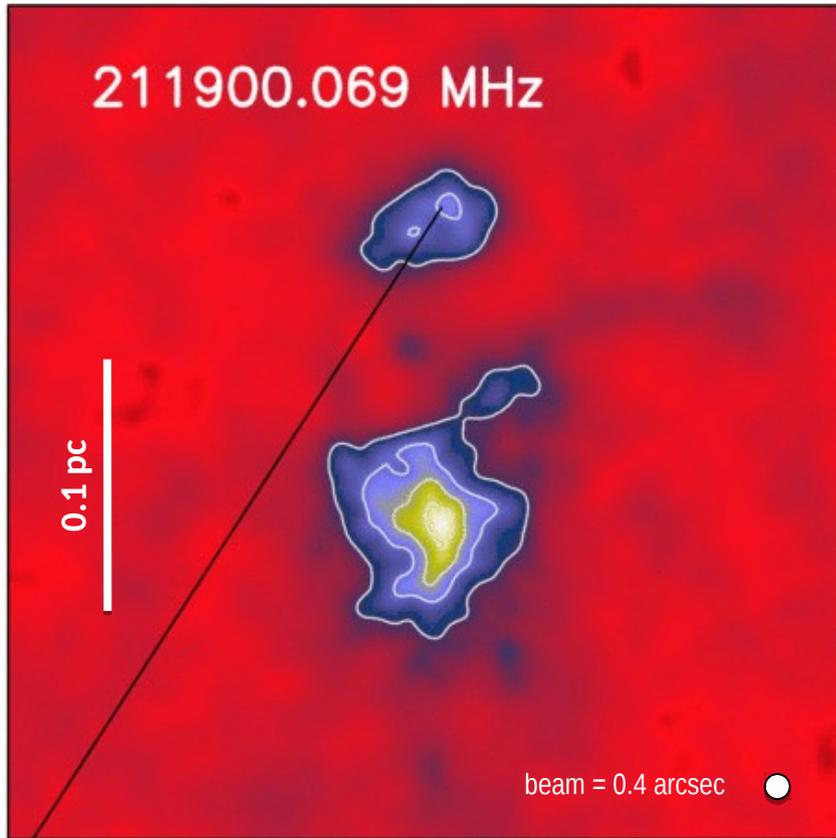

Spectrum (211-275 GHz) towards 1 single pixel

Spectrum (211-275 GHz) towards 1 single pixel

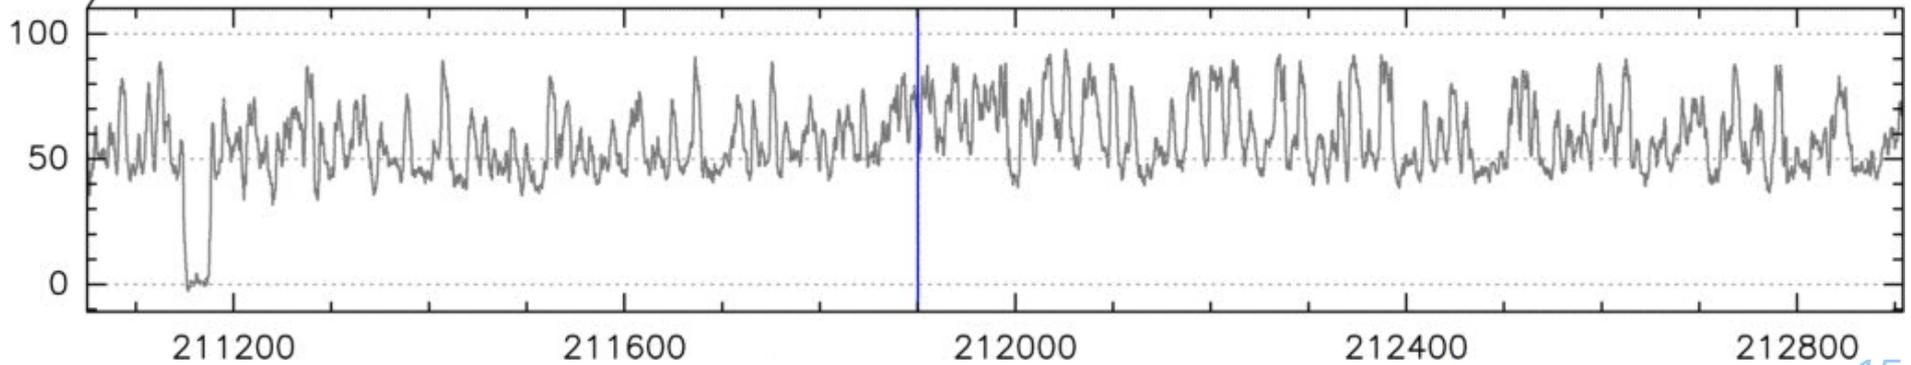

Chemically rich spectra !

First Problem: **continuum determination**

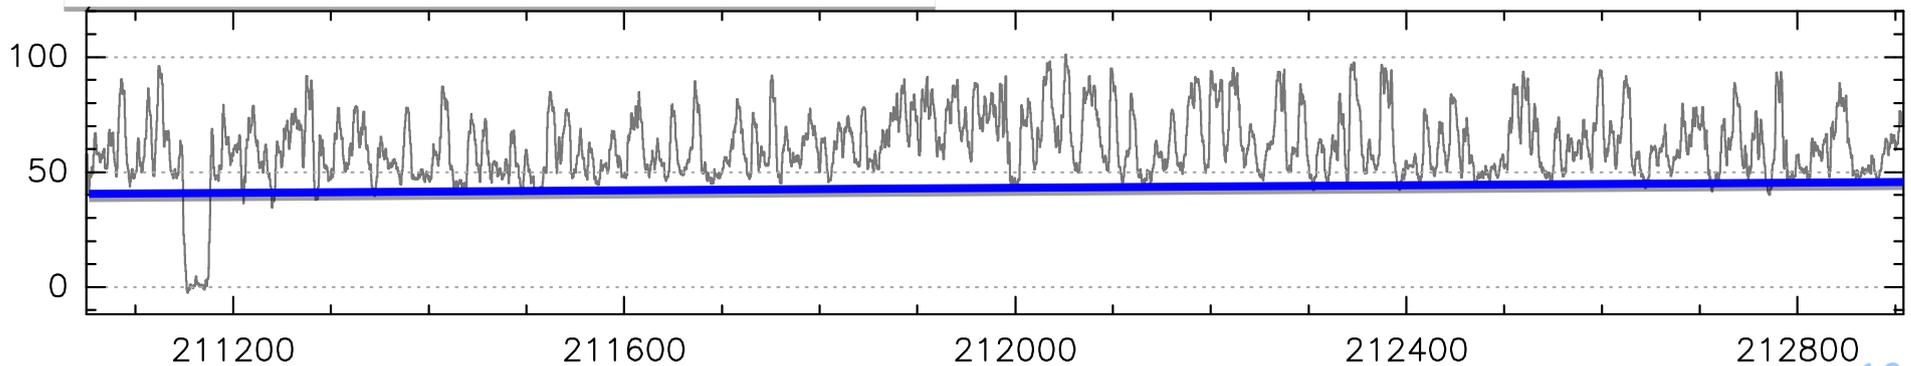

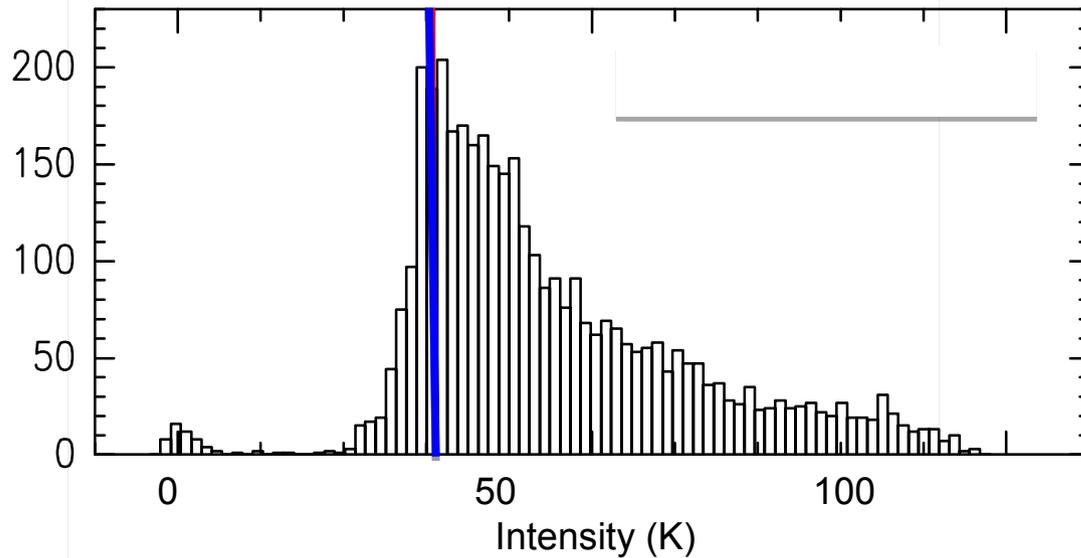

What is ALMA?
What about (astro)chemistry?

Continuum level determination

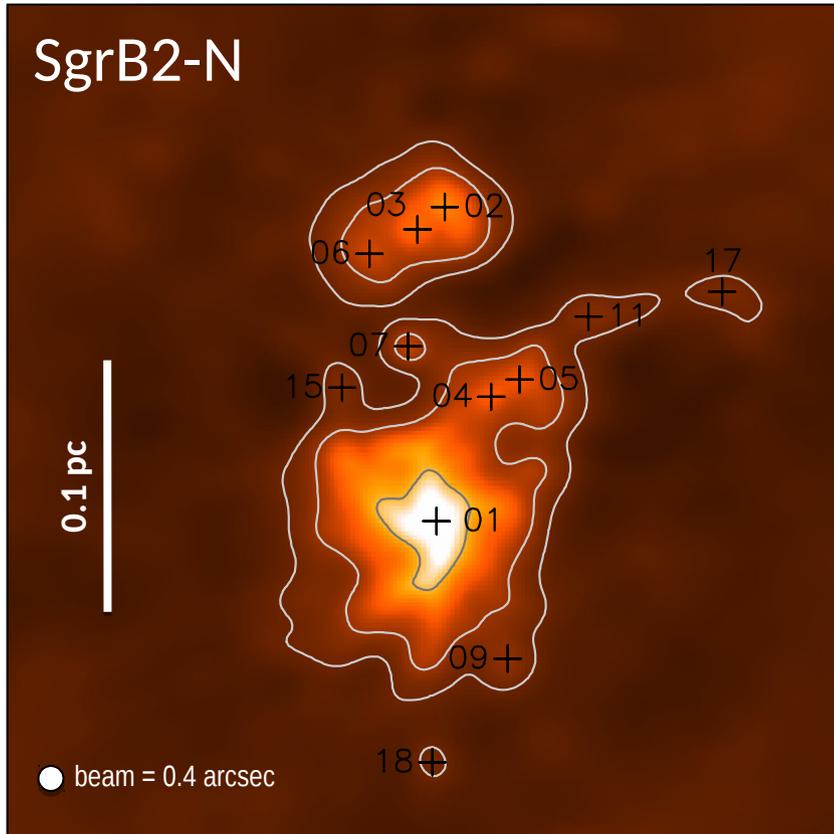

'subcont' : a new statistical method

Statistical analysis pixel by pixel

1. Extraction of the spectrum for each pixel
(over a given frequency range)
2. Sigma-clipping method
(discarding the outliers)
3. Determination of the continuum level after convergence

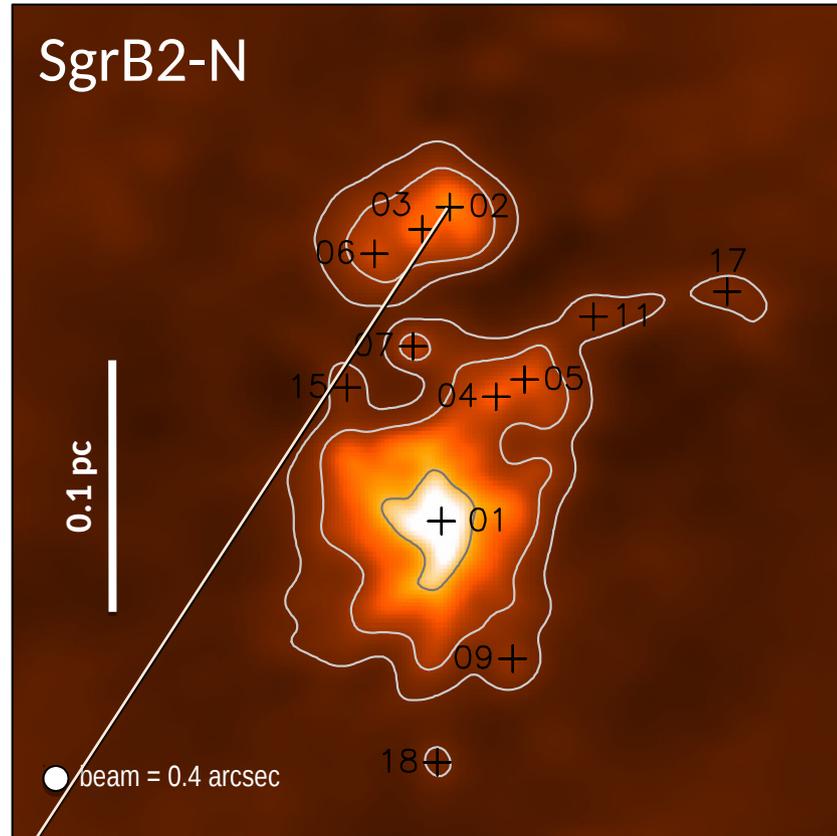

SgrB2-N

SgrB2-N continuum

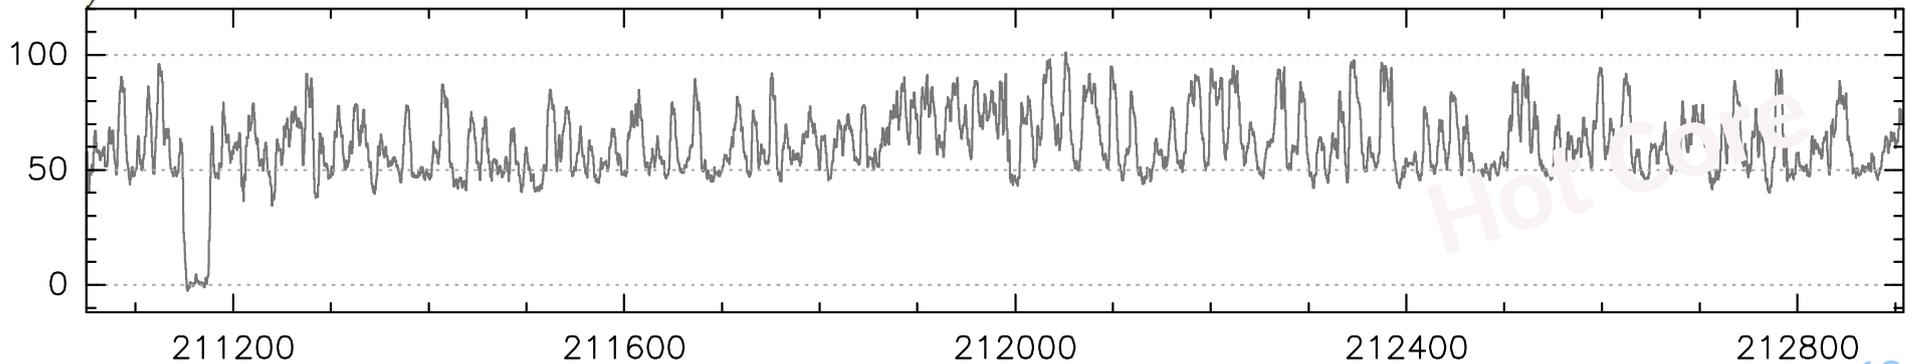

- Main core:
4600 M_{\odot} , 0.06 pc and 10^8 cm^{-3}
- **Monolithic structure**,
opacity effect ?, superposition of cores in 3D ?
contains HII regions (must fragment)
- Spiraling structure converging to the center
- Several small condensations,
with multiple hot molecular cores

SgrB2-N

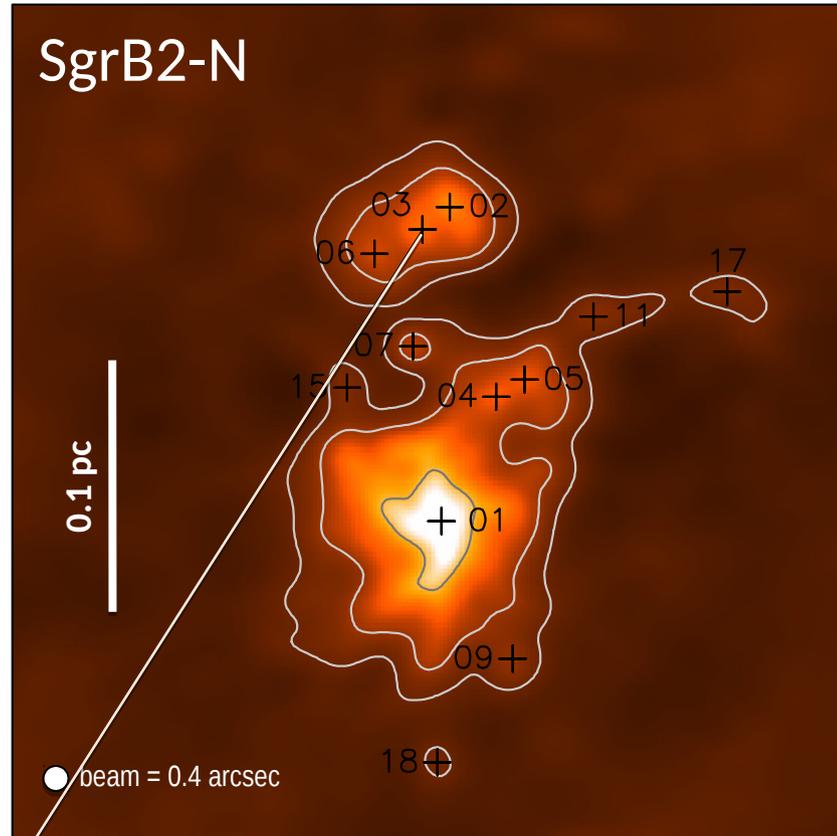

SgrB2-N continuum

- Main core:
4600 M_{\odot} , 0.06 pc and 10^8 cm^{-3}
- **Monolithic structure**,
opacity effect ?, superposition of cores in 3D ?
contains HII regions (must fragment)
- Spiraling structure converging to the center
- Several small condensations,
with multiple hot molecular cores

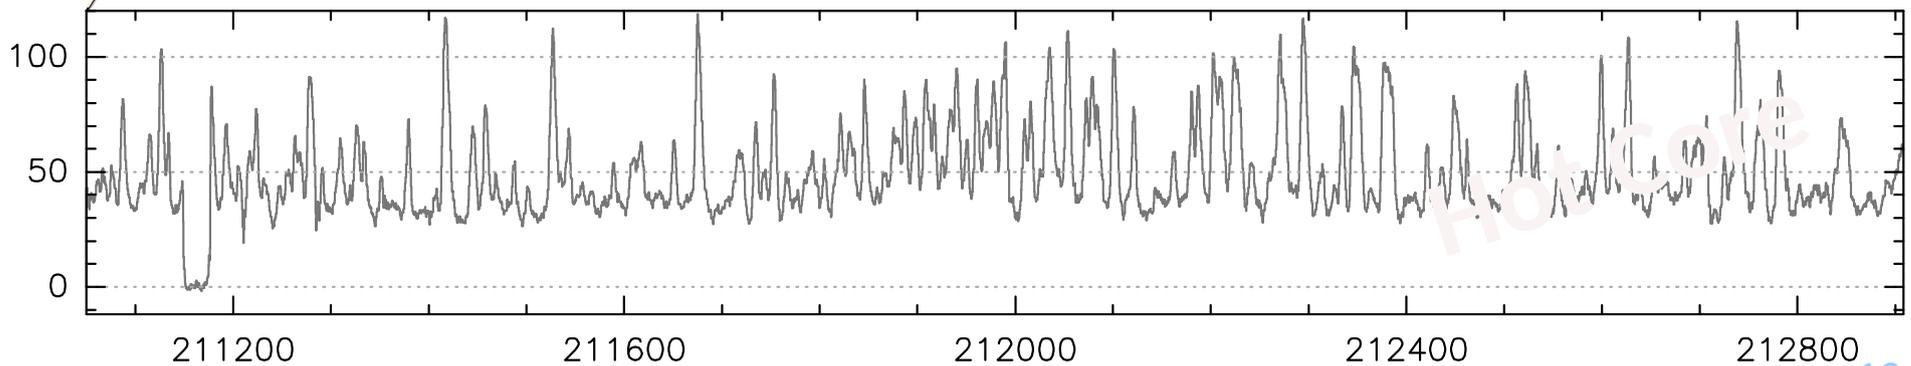

SgrB2-N

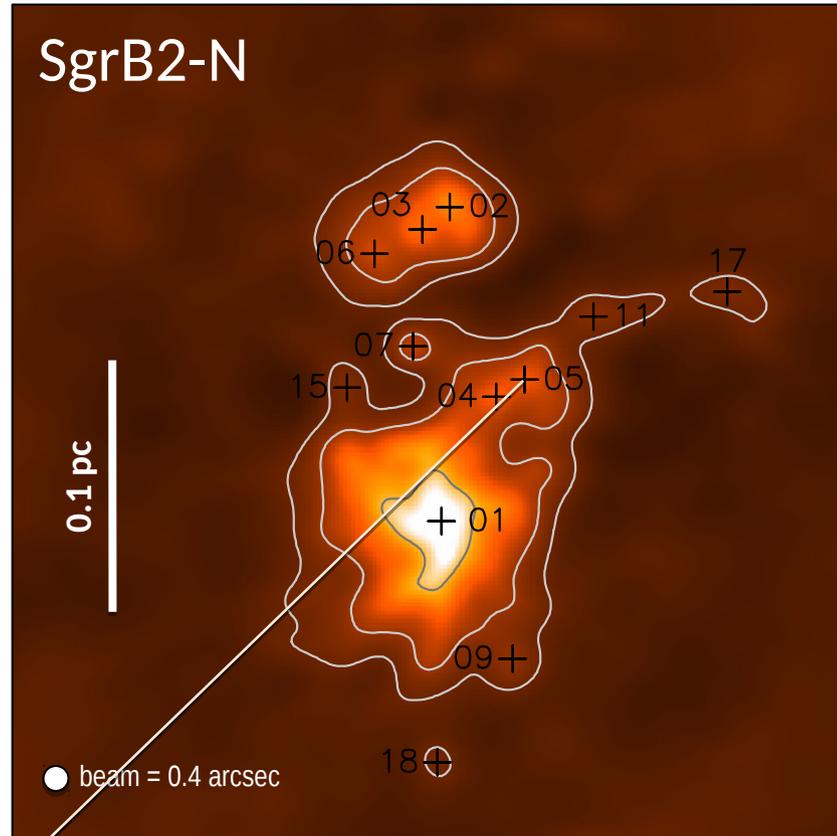

SgrB2-N continuum

- Main core:
4600 M_{\odot} , 0.06 pc and 10^8 cm^{-3}
- **Monolithic structure**,
opacity effect ?, superposition of cores in 3D ?
contains HII regions (must fragment)
- Spiraling structure converging to the center
- Several small condensations,
with multiple hot molecular cores

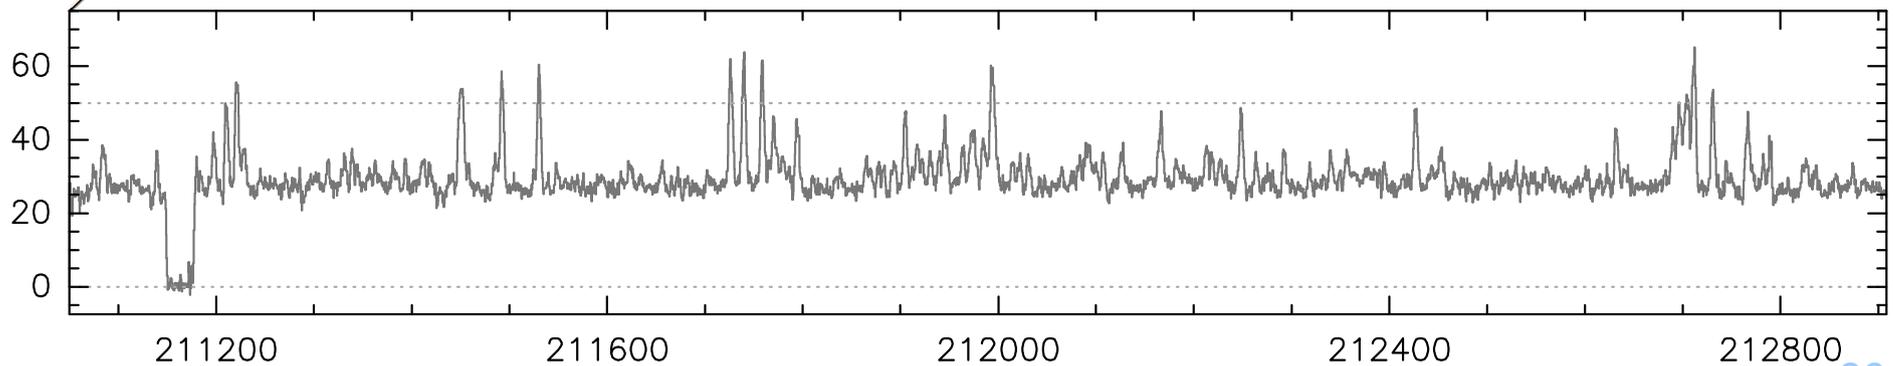

SgrB2-N

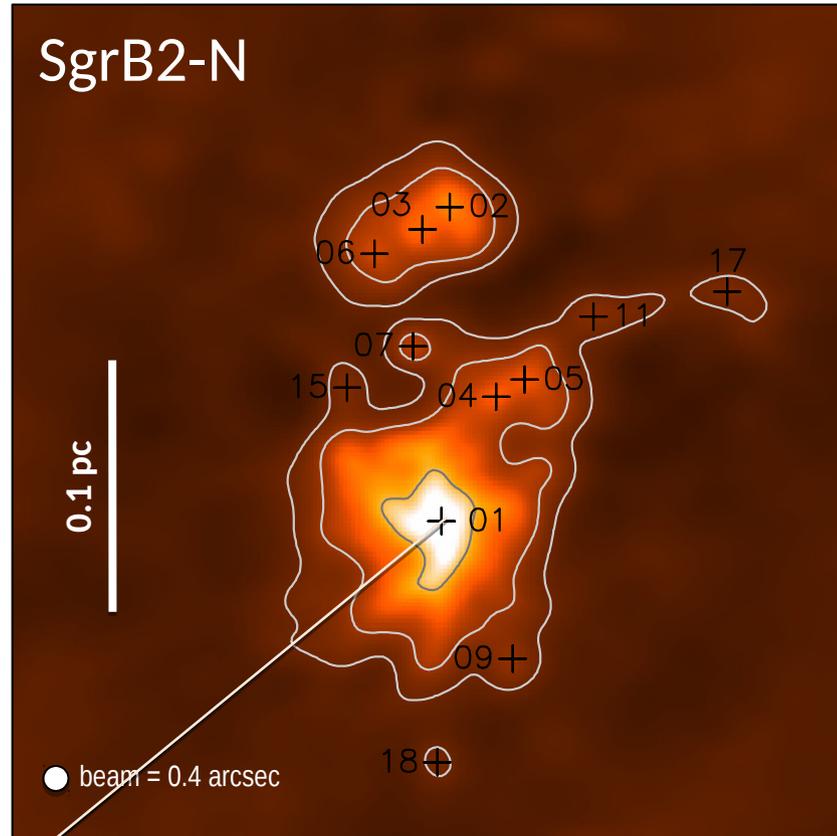

SgrB2-N continuum

- Main core:
4600 M_{\odot} , 0.06 pc and 10^8 cm^{-3}
- **Monolithic structure**,
opacity effect ?, superposition of cores in 3D ?
contains HII regions (must fragment)
- Spiraling structure converging to the center
- Several small condensations,
with multiple hot molecular cores

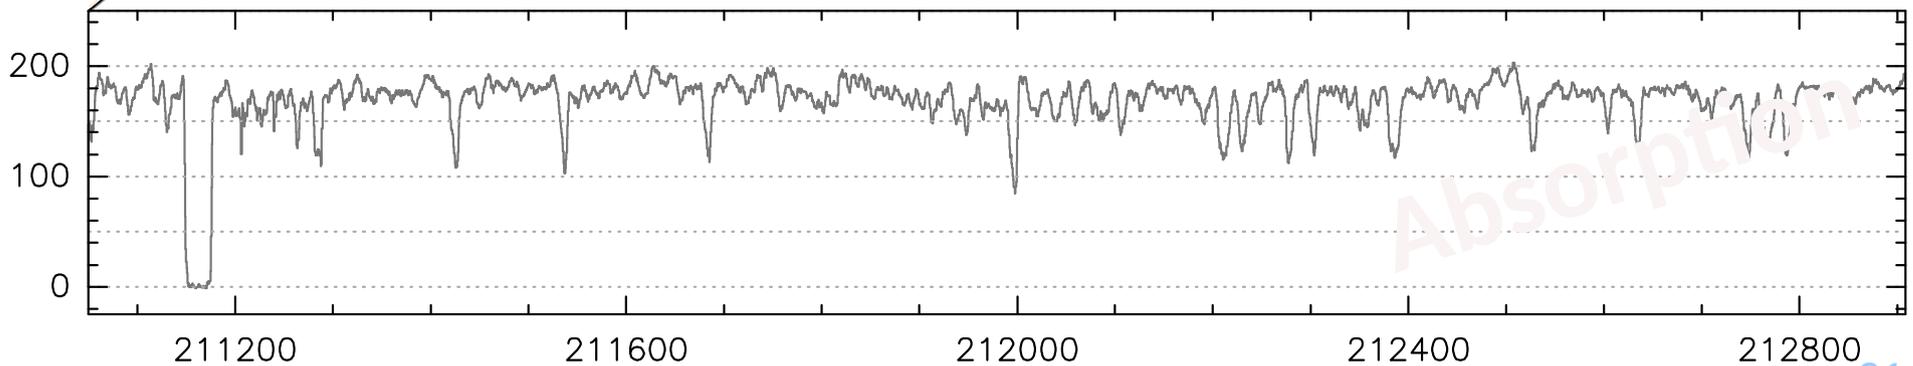

SgrB2-N

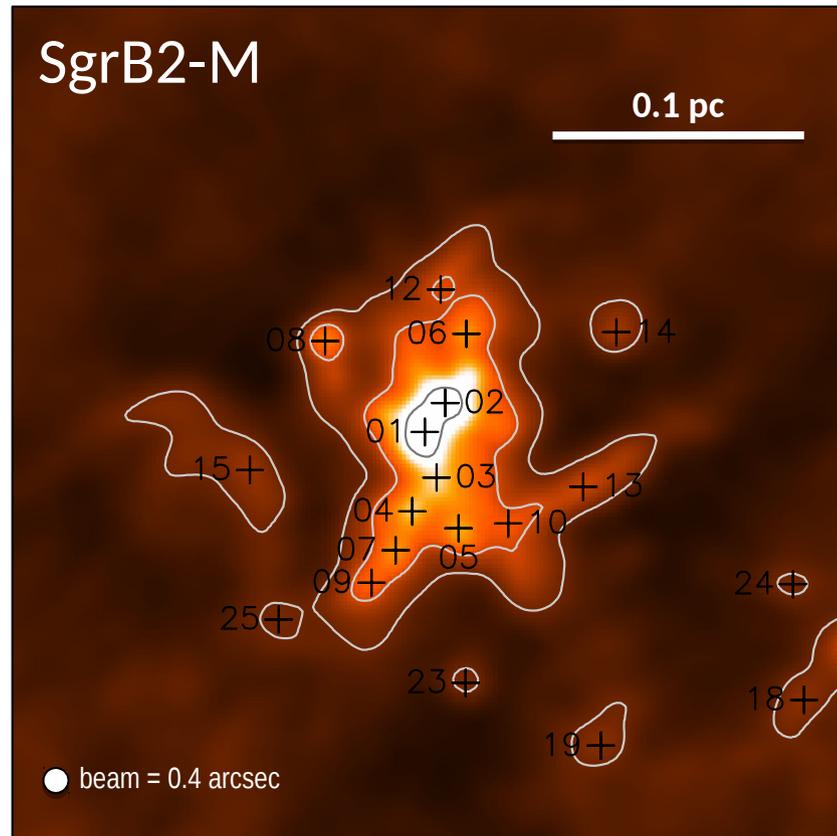

SgrB2-N continuum

- Main core:
4600 M_{\odot} , 0.06 pc and 10^8 cm^{-3}
- **Monolithic structure**,
opacity effect ?, superposition of cores in 3D ?
contains HII regions (must fragment)
- Spiraling structure converging to the center
- Several small condensations,
with multiple hot molecular cores

SgrB2-M

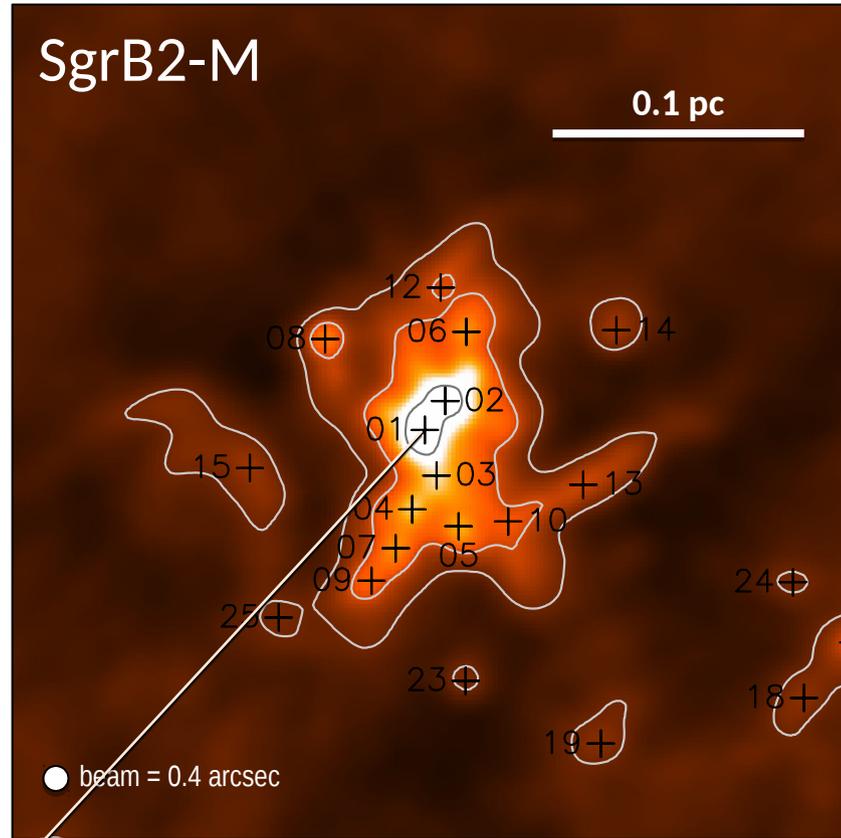

SgrB2-M continuum

- Two main (central) cores:
1100 M_{\odot} , 0.02 pc and $5 \times 10^8 \text{ cm}^{-3}$
- **Highly fragmented**, with elongated structures
- 1 mm continuum heavily affected by free-free (ionized gas) emission
- Deep absorptions towards condensations, due to bright hypercompact HII regions

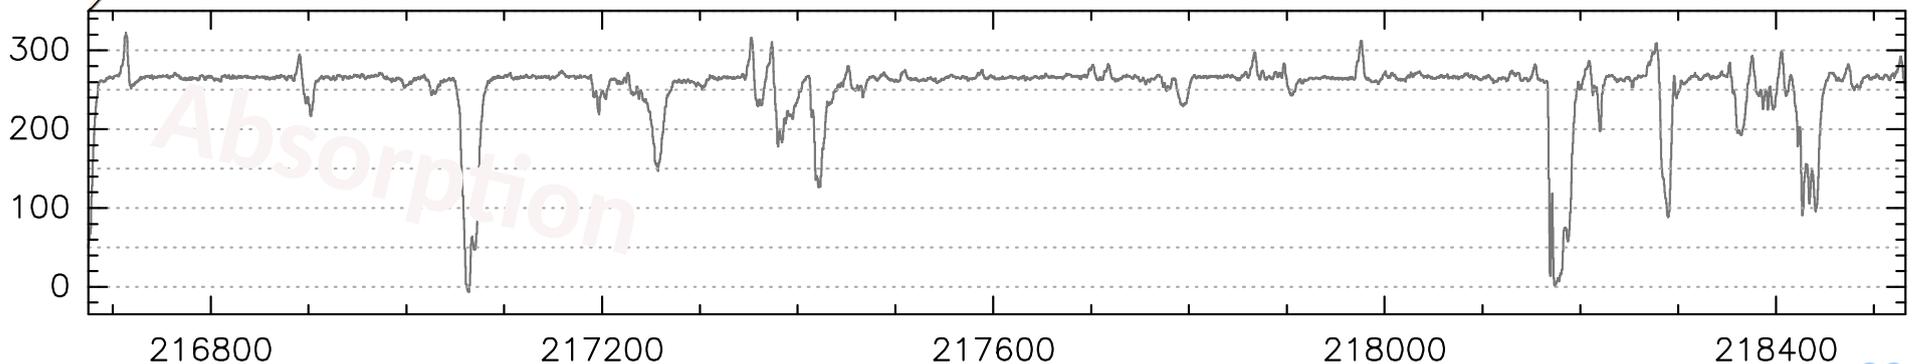

SgrB2-M

0.1 pc

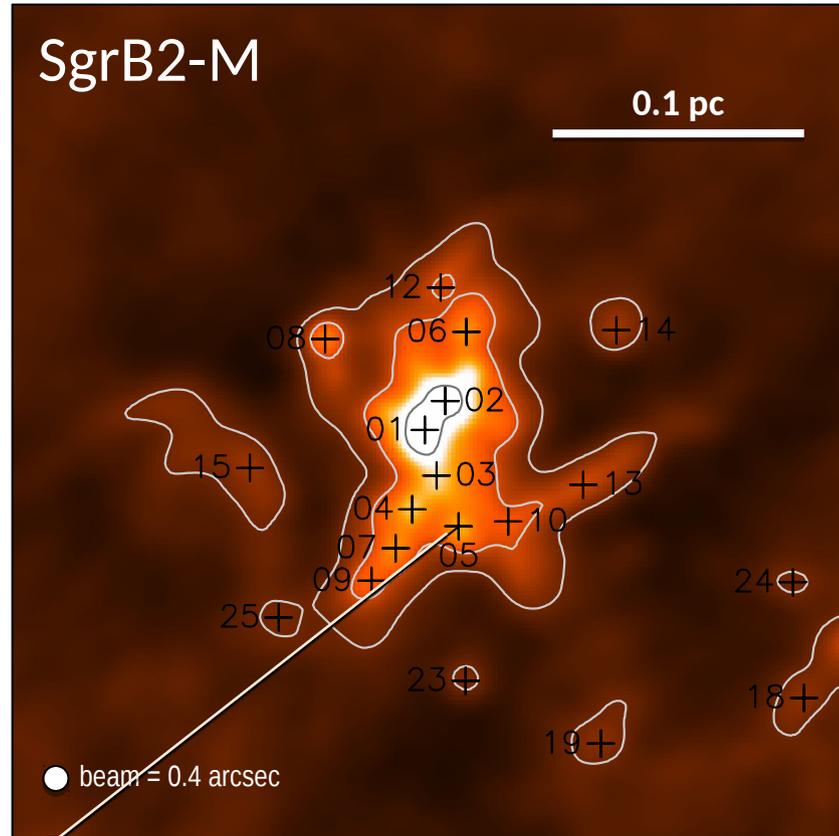

SgrB2-M continuum

- Two main (central) cores: $1100 M_{\odot}$, 0.02 pc and $5 \times 10^8 \text{ cm}^{-3}$
- **Highly fragmented**, with elongated structures
- 1 mm continuum heavily affected by free-free (ionized gas) emission
- Deep absorptions towards condensations, due to bright hypercompact HII regions

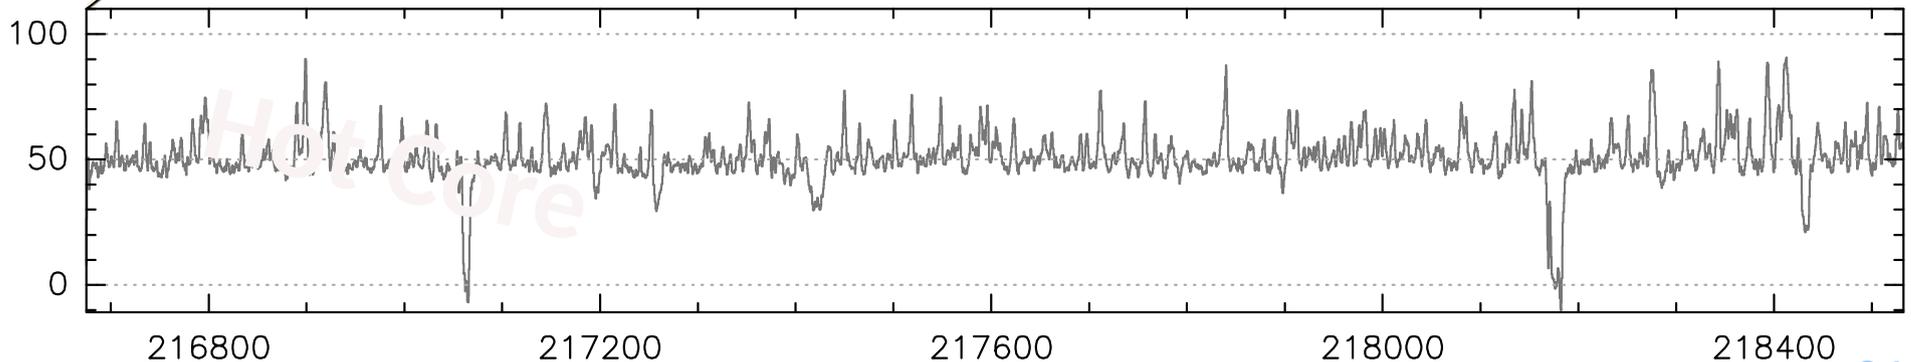

SgrB2-M

0.1 pc

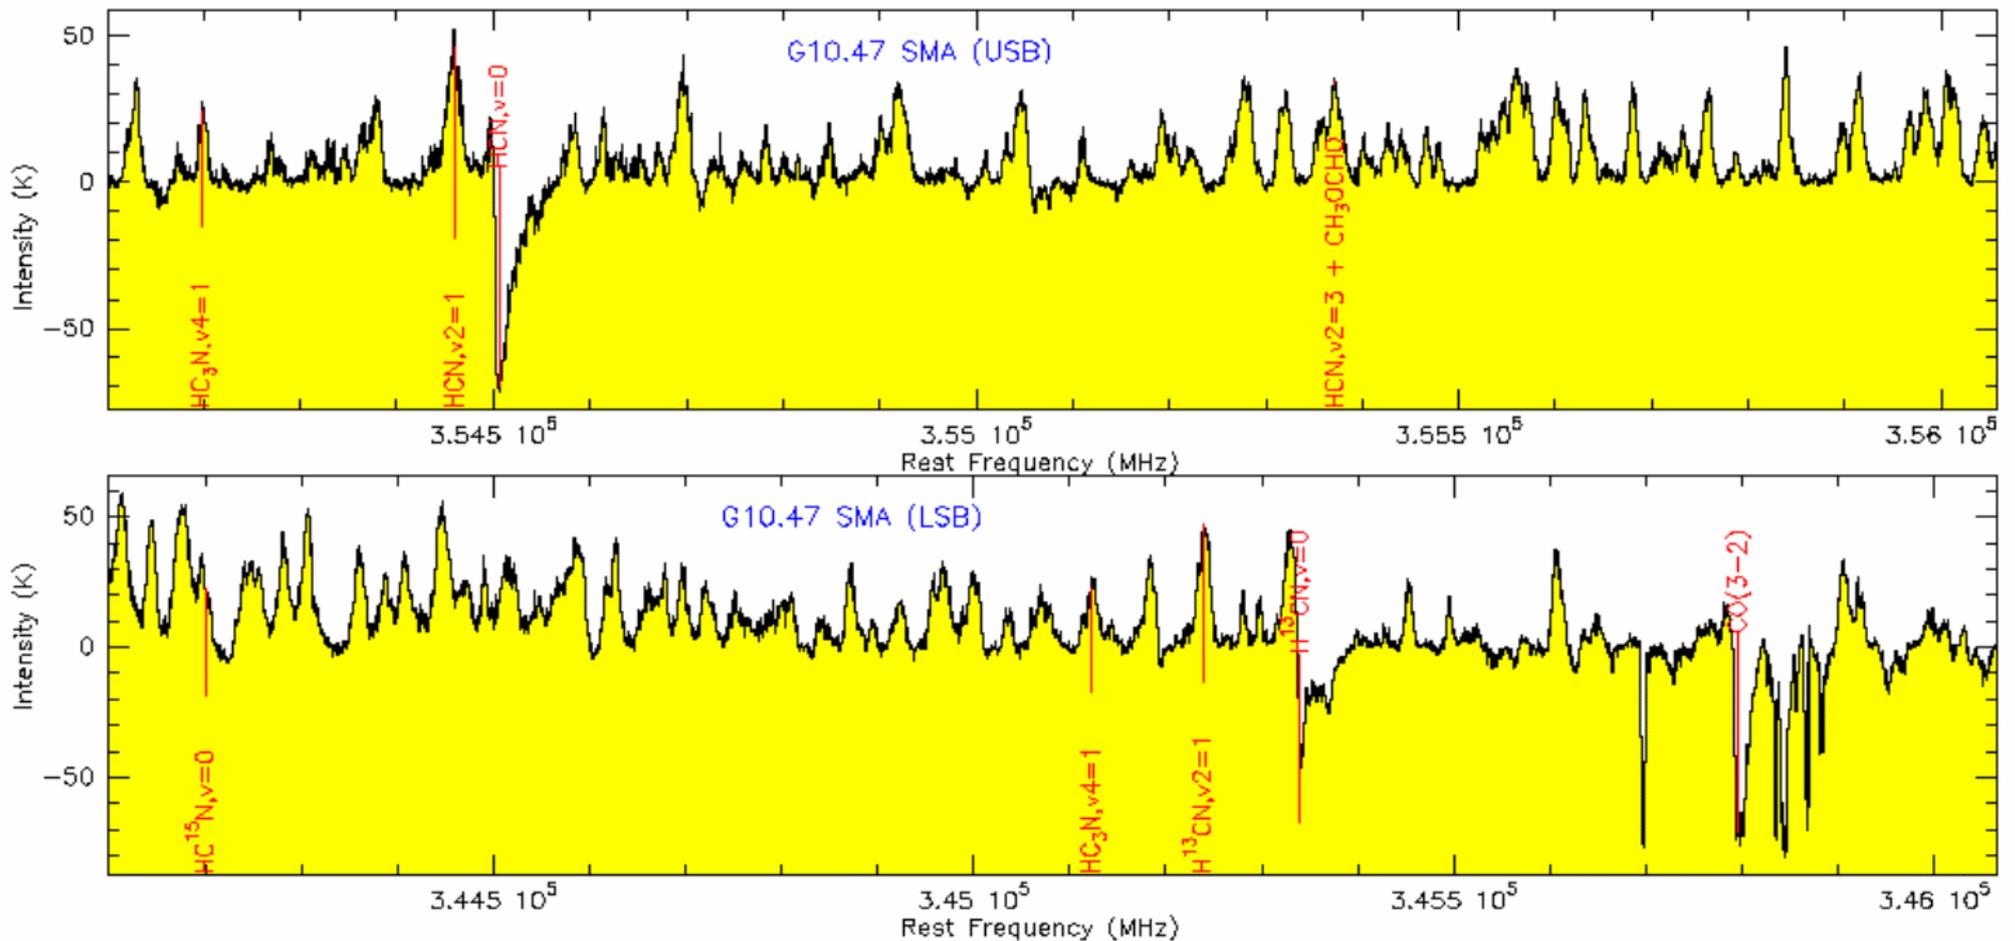

SgrB2-M continuum

- Two main (central) cores:
1100 M_{\odot} , 0.02 pc and $5 \times 10^8 \text{ cm}^{-3}$
- **Highly fragmented**, with elongated structures
- 1 mm continuum heavily affected by free-free (ionized gas) emission
- Deep absorptions towards condensations, due to bright hypercompact HII regions

Not only ALMA

SMA spectra toward the central position of G10.47

What do we need?

- Identify as many lines as possible **fast**
- Determine physical parameters **fast**
- We have maps: need to do this for all pixels – **fast**
- ... to allow astrophysicists to spend their time to do a scientific analysis

How do we do this?

- Option A

How do we do this?

- Option B

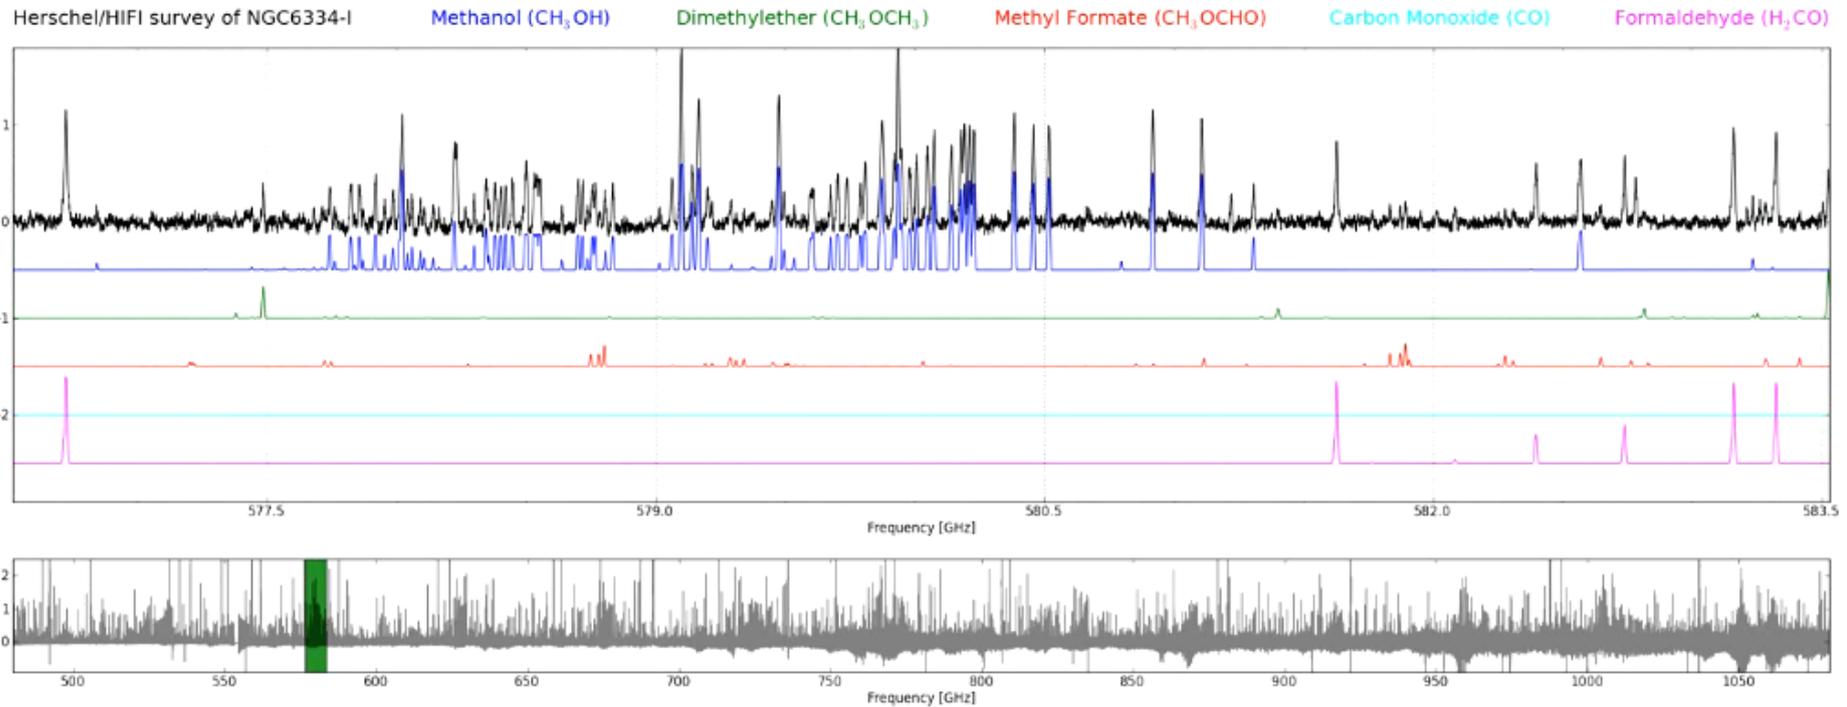

Option B: XCLASS

XCLASS generates **synthetic spectra** in LTE approximation

Automatic optimization of parameters using many different algorithms

MPI parallelized

Using CDMS/VAMDC data bases

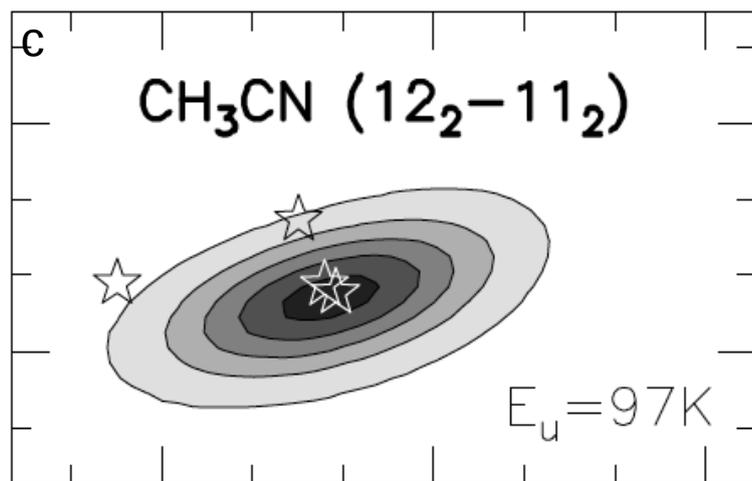

Herschel/HIFI survey of NGC6334-I obtained within the CHESS project (PI: C. Ceccarelli)

Line modeling using myXCLASS by A. Zernickel et al. (2012, A&A, 546, 87)

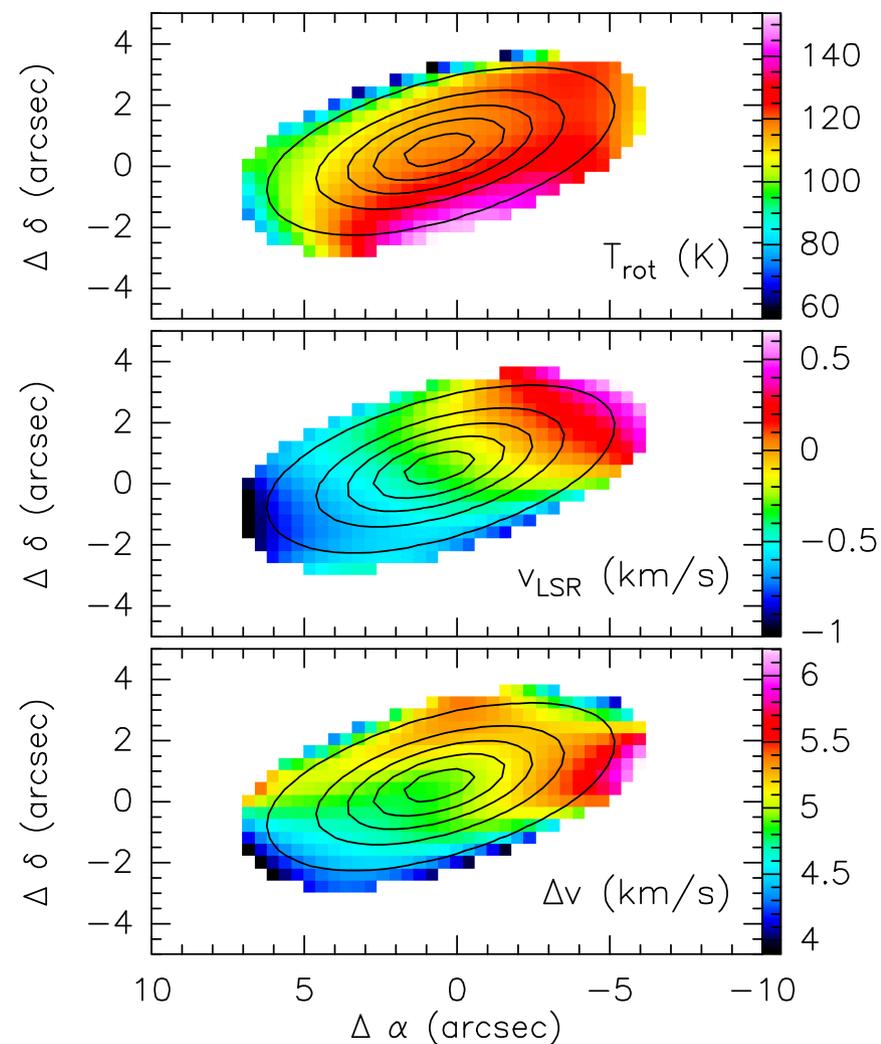

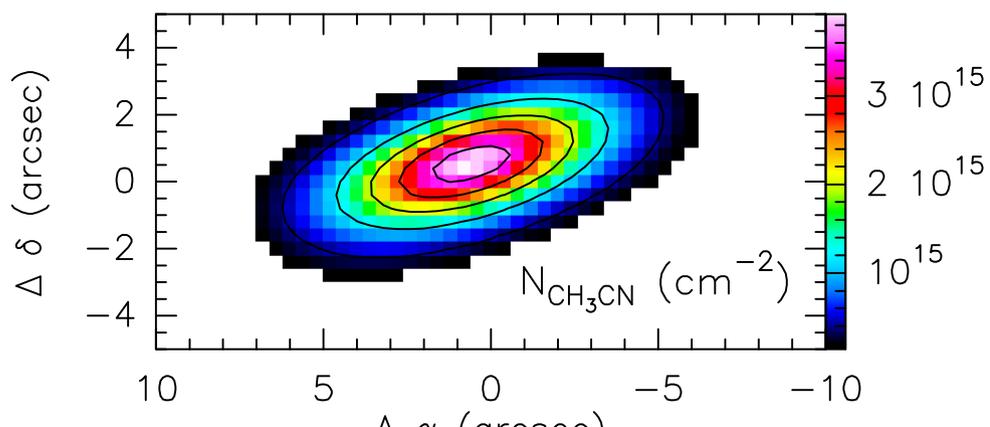

Movie by A. Schiedeke (2014)

Option B: XCLASS

example of **myXCLASSMapFit**:
- from CH₃CN line fitting

Example of myXCLASSMapFit

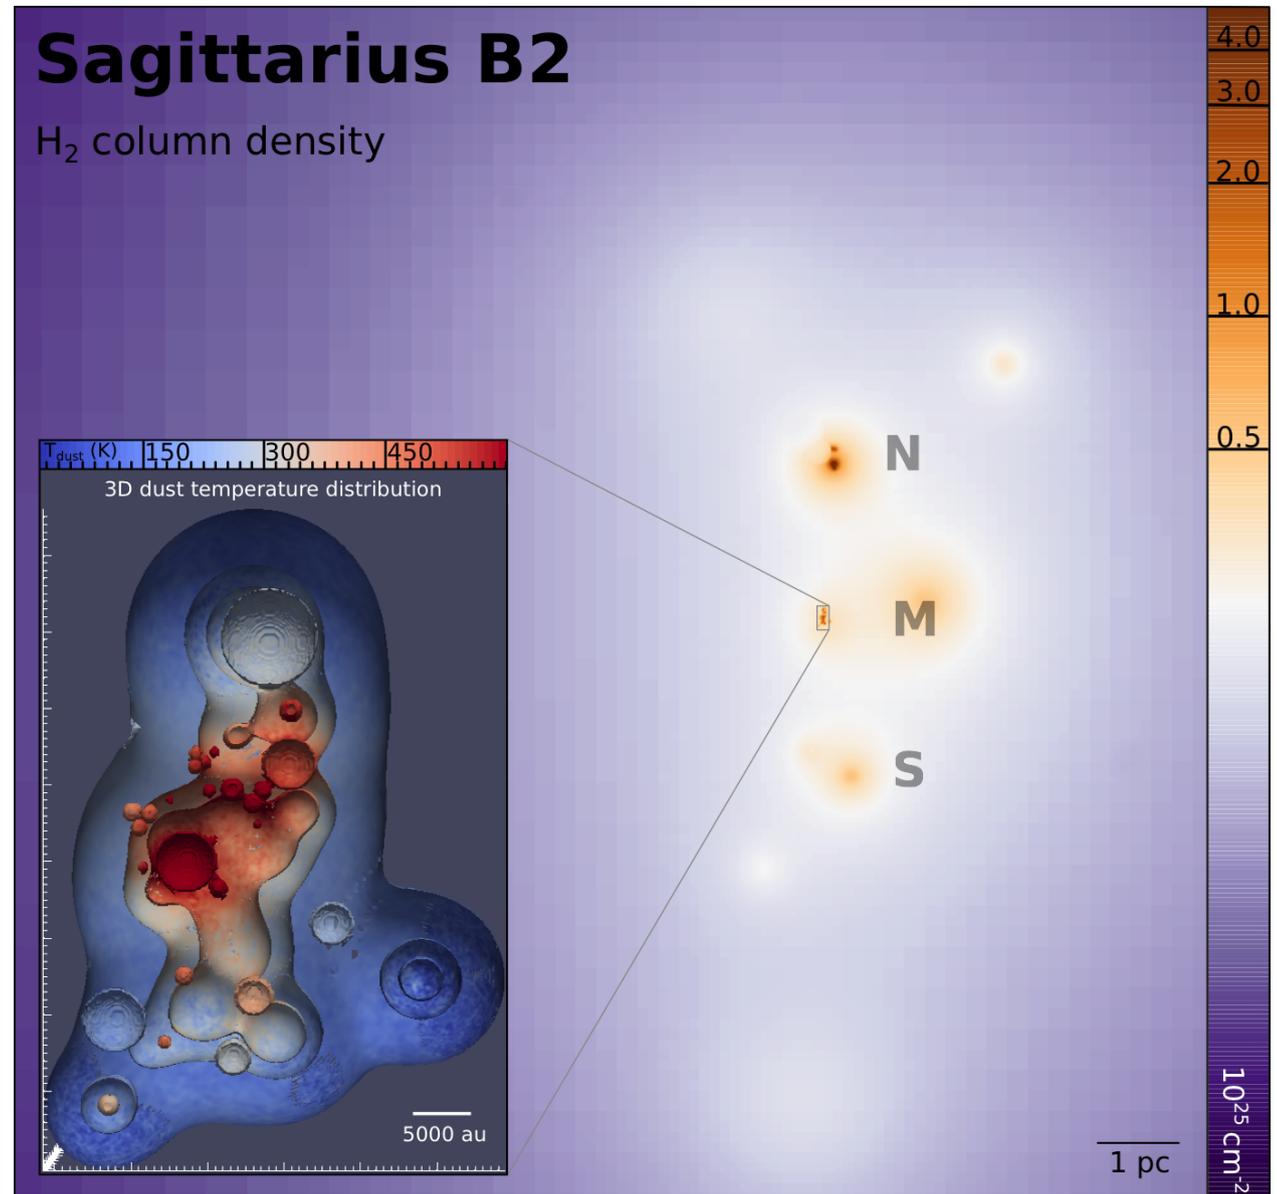

Option C: more sophisticated RT

Pandora

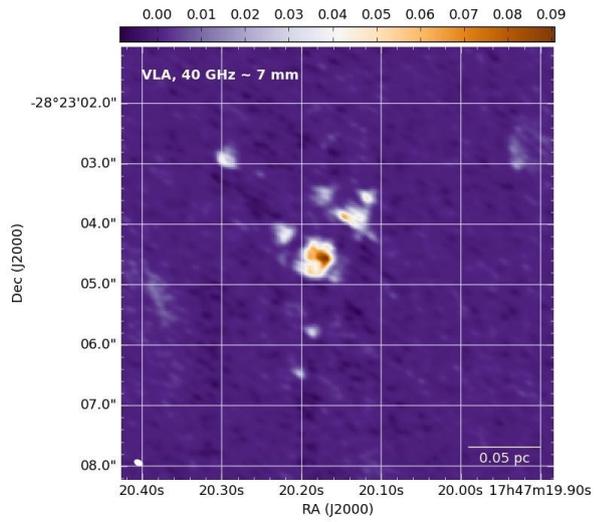

Python framework, versatile
3D radiative transfer modeling
[Schmiedeke et al. 2016]

- Uses RADMC-3D and LIME to model dust continuum and line emission
- Input parameters:
 - dense cores
 - HII regions
- Kinematics included:
 - infall (free-fall)
 - rotation (Keplerian)
 - outflow

DATA

MODEL

CH₃CN data

MODELING of Spectral Lines

- 3D radiative transfer model (using [Pandora](#))

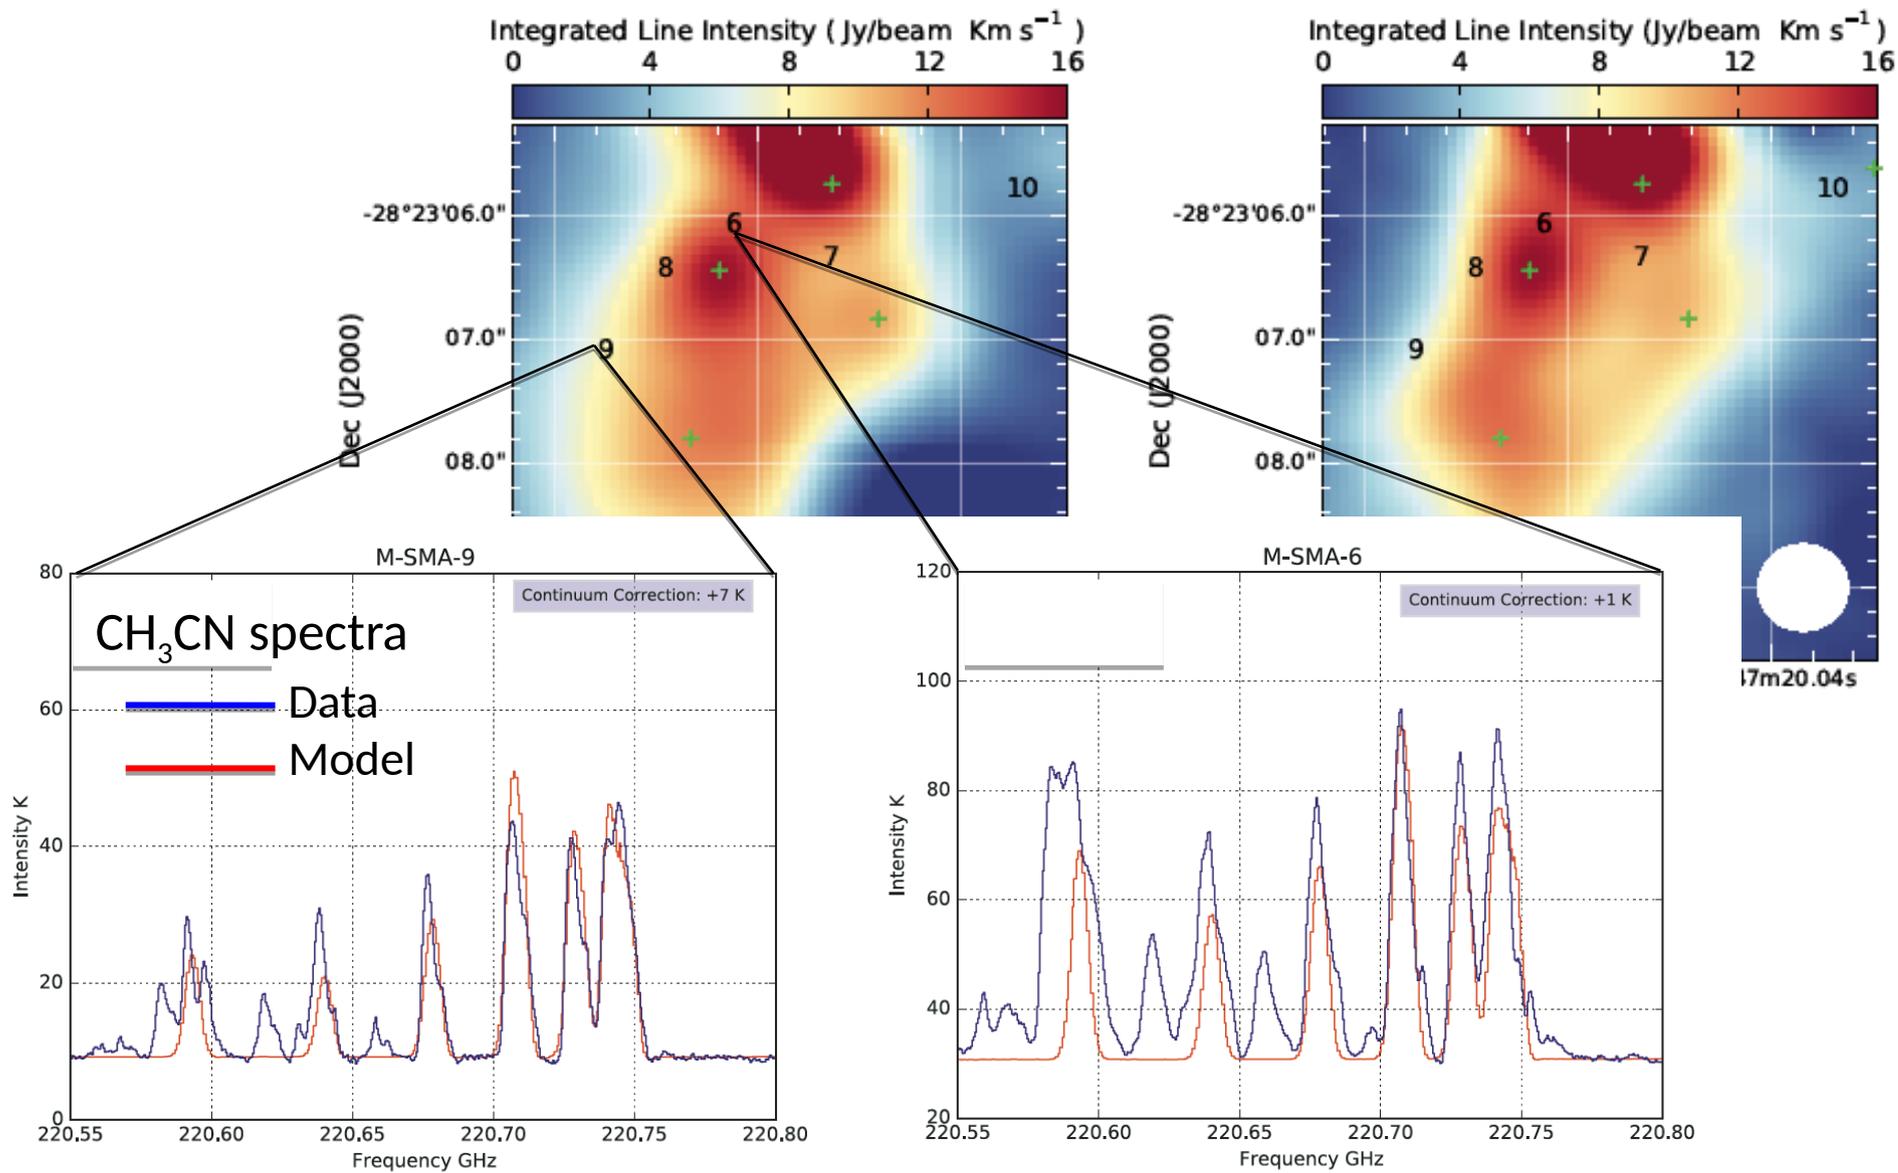

CH₃CN model

CH₃CN data

MODELING of Spectral Lines

- 3D radiative transfer model (using [Pandora](#))

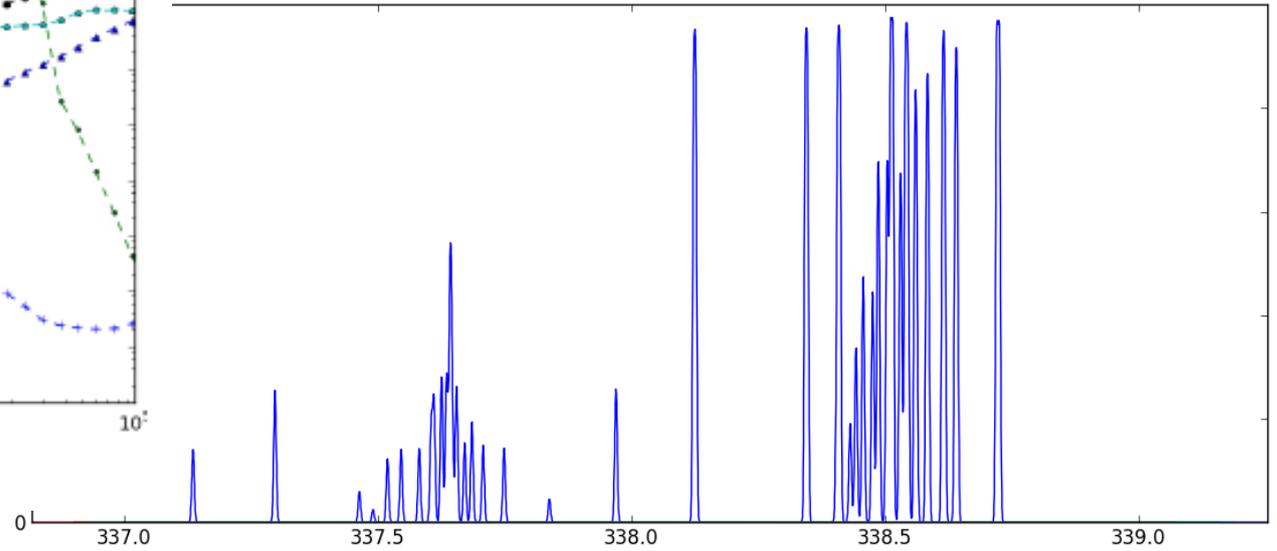

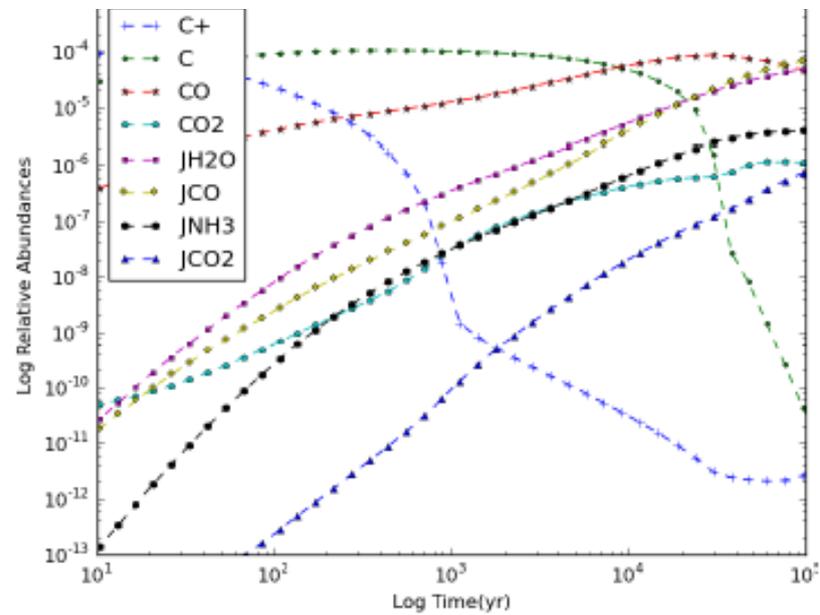

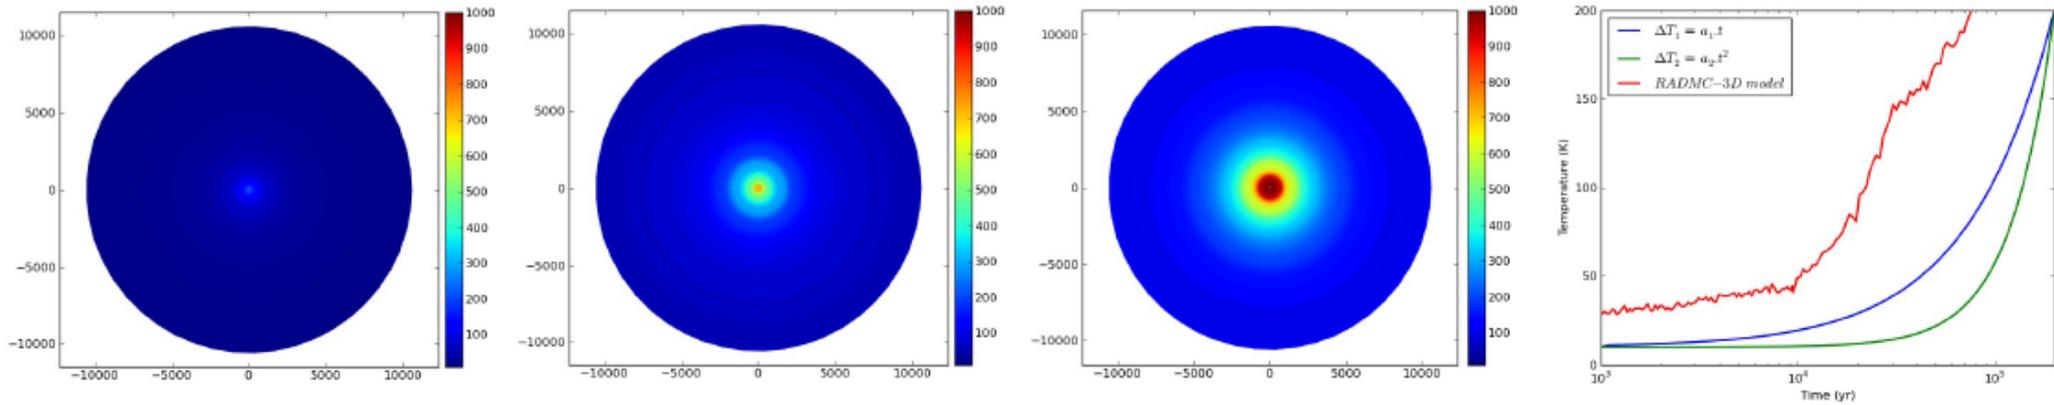

Needs integrated chemical models for interpretation

Example:

Saptarsy (Choudhury et al. 2015, Stéphan et al. 2017)

needed: thermal evolution, dynamics, initial conditions

Summary

- Chemistry in Star Formation is a powerful tool
 - To determine past and present physical parameters
 - Ages (chemical clock), feedback effects, ...
 - Requires fast, automatic data analysis and classification
 - Comparison with chemical models producing spectra
 - Needs good statistics, also in number of sources
 - For wSMA, I recommend large, coherent programs for maximum impact

Summary

- Chemistry in Star Formation is a powerful tool
 - To determine past and present physical parameters
 - Ages (chemical clock), feedback effect, ...
 - Requires fast, automatic data analysis
 - Comparison with chemical models producing spectra
 - Needs good statistics, also in number of sources
 - For wSMA, I recommend large, coherent programs for maximum impact

Paradigm change

(partly based on thoughts by Felix Stoehr)

- Past:
 - Observers had to struggle to get data (“Proposals”)
 - Few data: small bandwidths, low sensitivity, low resolution (low spatial dynamic range, blobs)
 - Easy analysis, fast publication
- Now:
 - SMA, ALMA and JVLA produce vast amounts of data, available through archives
 - Many data: large bandwidths, high sensitivity, high resolution (high spatial dynamic range)
 - Difficult analysis, slow publication

Paradigm change

(partly based on thoughts by Felix Stoehr)

- Past:
 - Demand driven economy
 - Observatories had to deliver some data, in some format and leave the rest to the users
 - Enough to survive as observatory
- Now:
 - Supply driven economy
 - Observatories have to help observers by delivering calibrated images and providing analysis tools to ensure high enough publication rates and thus, survival
